Development of the ovary

Presence of XX & absence of XY

primitive sex cords dissociate into irregular cell clusters (medullary cords of the ovary)

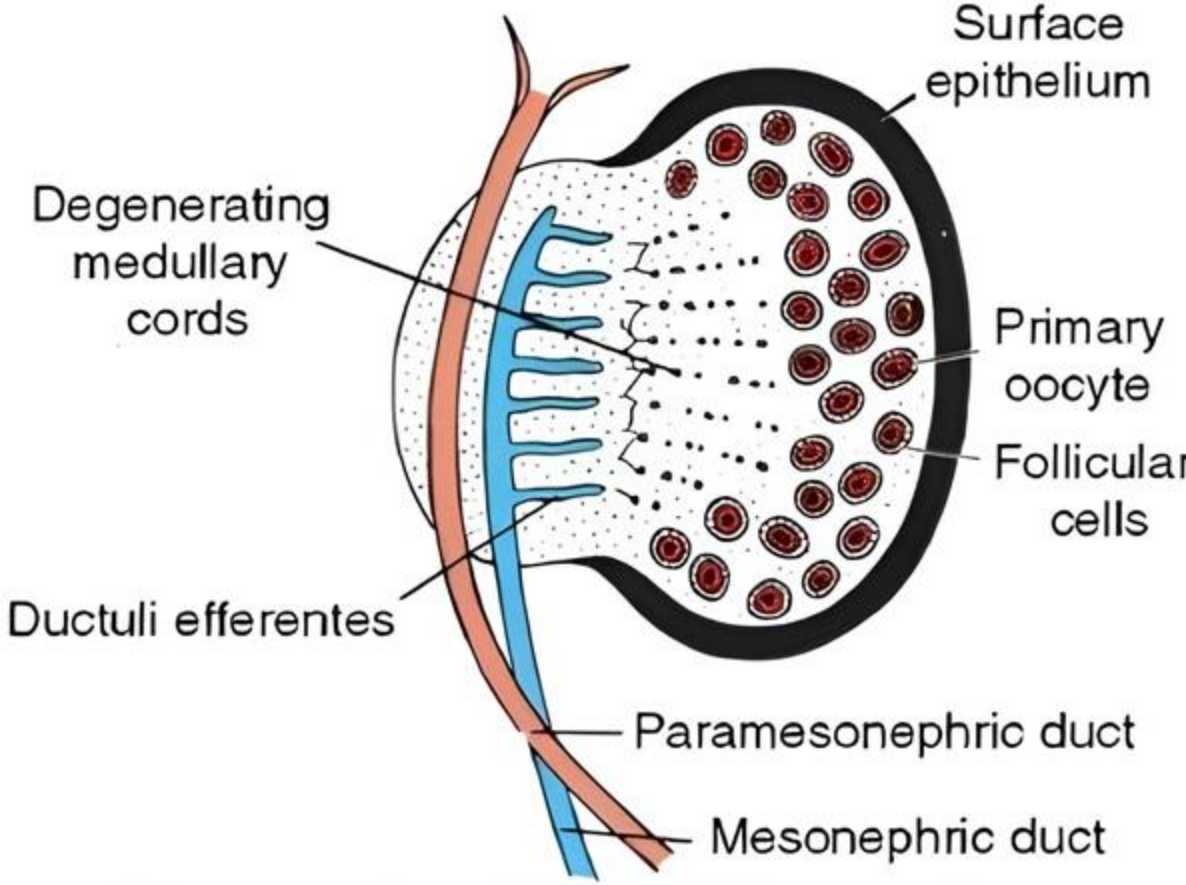

ANU MEDICAL SCHOOL PROGRAM

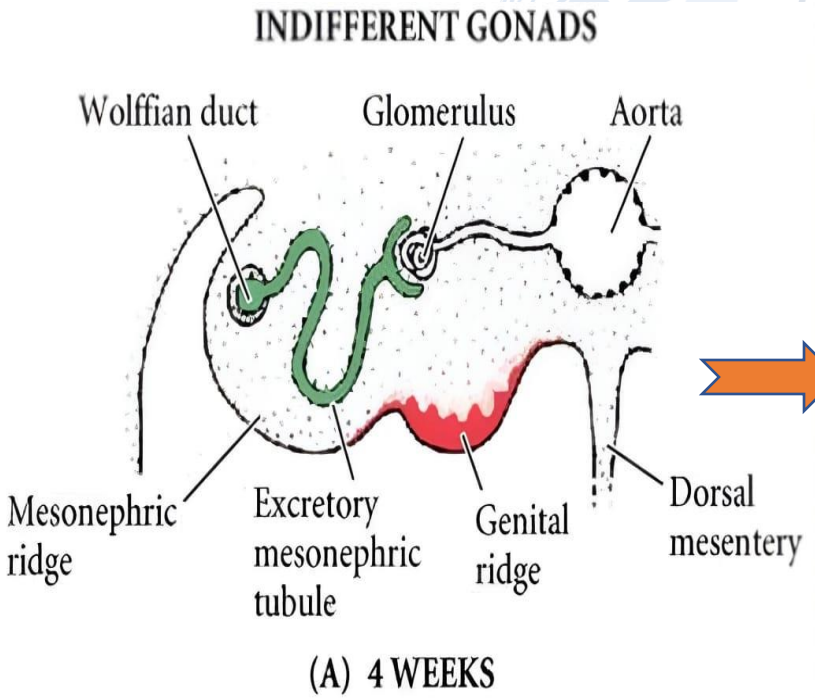

Development of the ovary

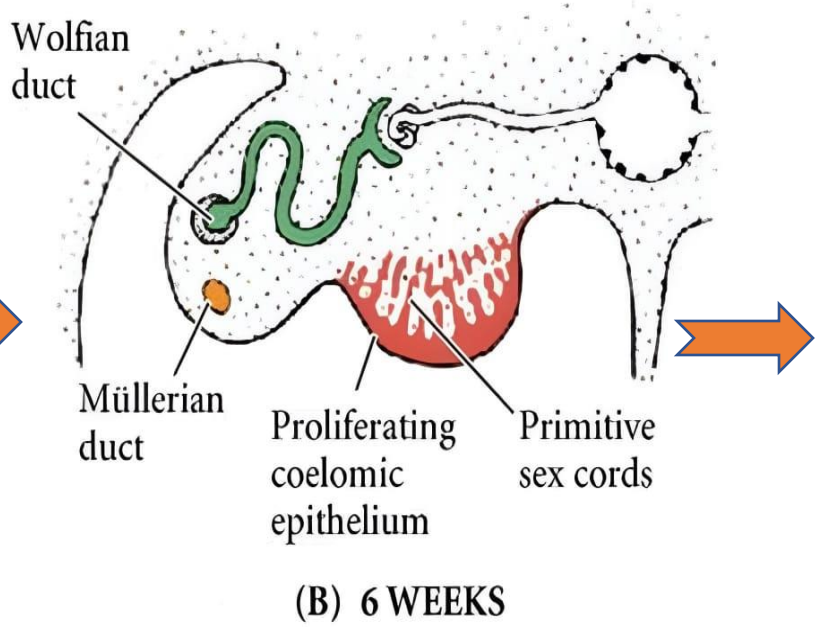

- These clusters form medullary cords and occupy the medullary part of the ovary.

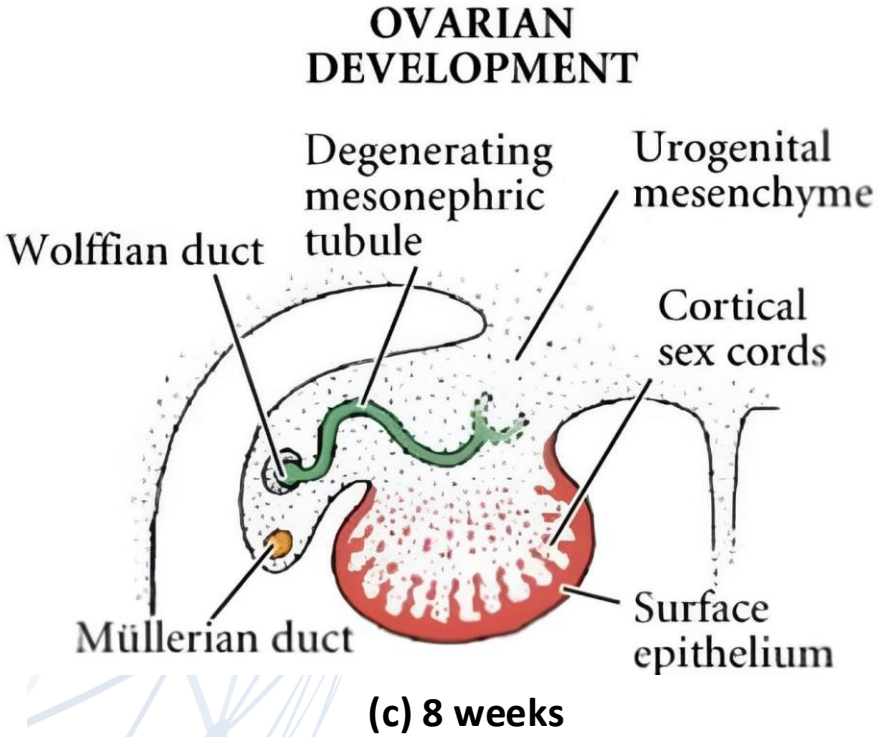

- Later, they disappear and are replaced by a vascular stroma that forms the ovarian medulla.

Development of the ovary

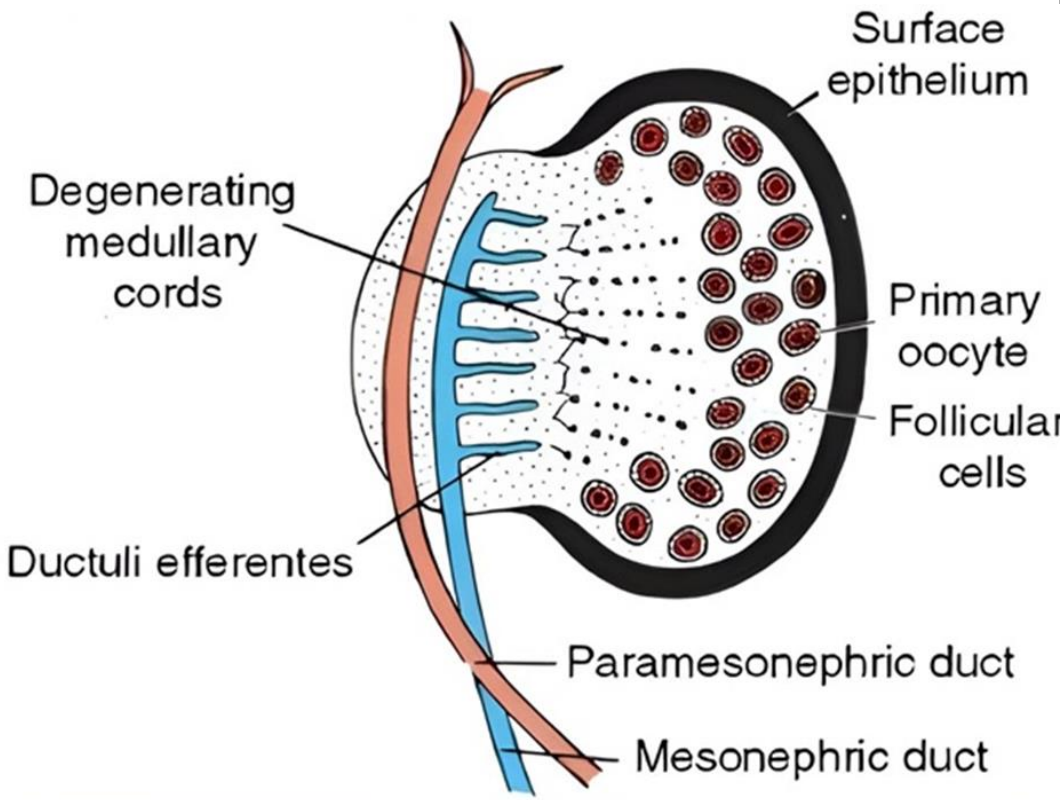

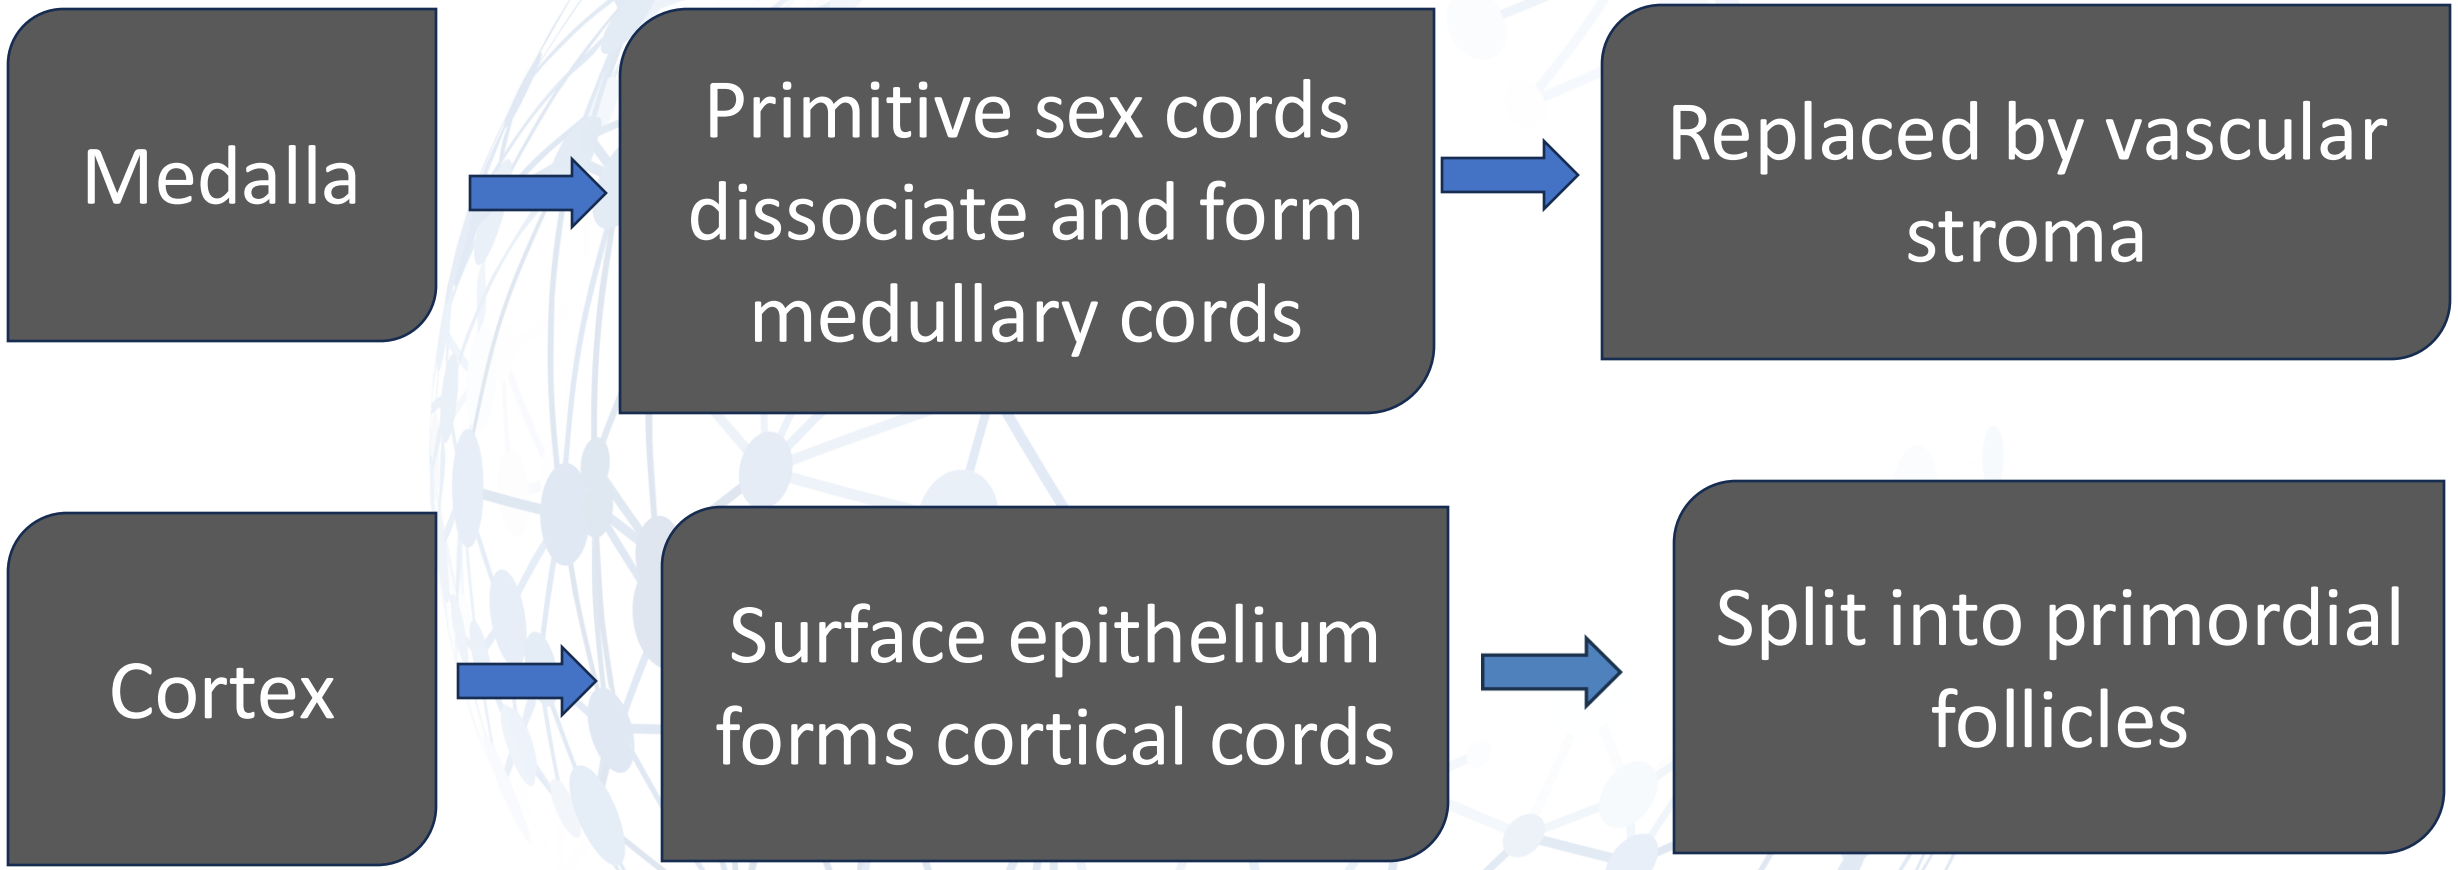

ANU MEDICAL SCHOOL PROGRAM

Development of the ovary

- The surface epithelium continues to proliferate and gives rise to 2nd generation of cords (cortical cords).
- As the cortical cords increase in size, primordial germ cells are incorporated into them.
- The cortical cords are split into primordial follicles each consists of oogonia (developed from primordial germ cells) surrounded by follicular cells.

Medalla
Primitive sex cords dissociate and form medullary cords
Replaced by vascular stroma
Cortex
Surface epithelium forms cortical cords
Split into primordial follicles
