The development of Vagina

vagina

Upper 3/5 from uterovaginal canal (mesodermal)

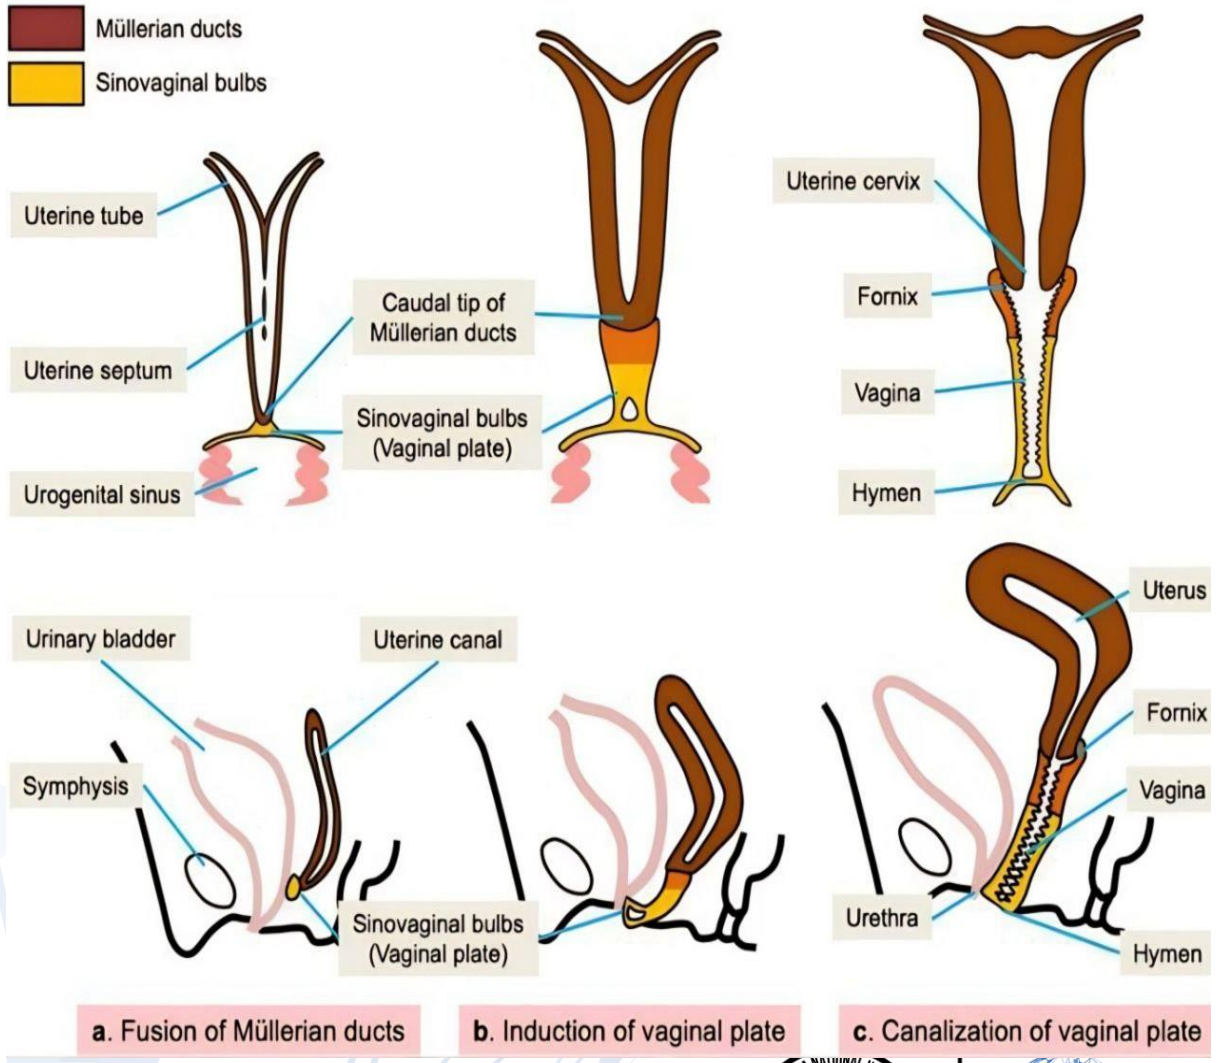

Lower 2/5 from urogenital sinus (endodermal).

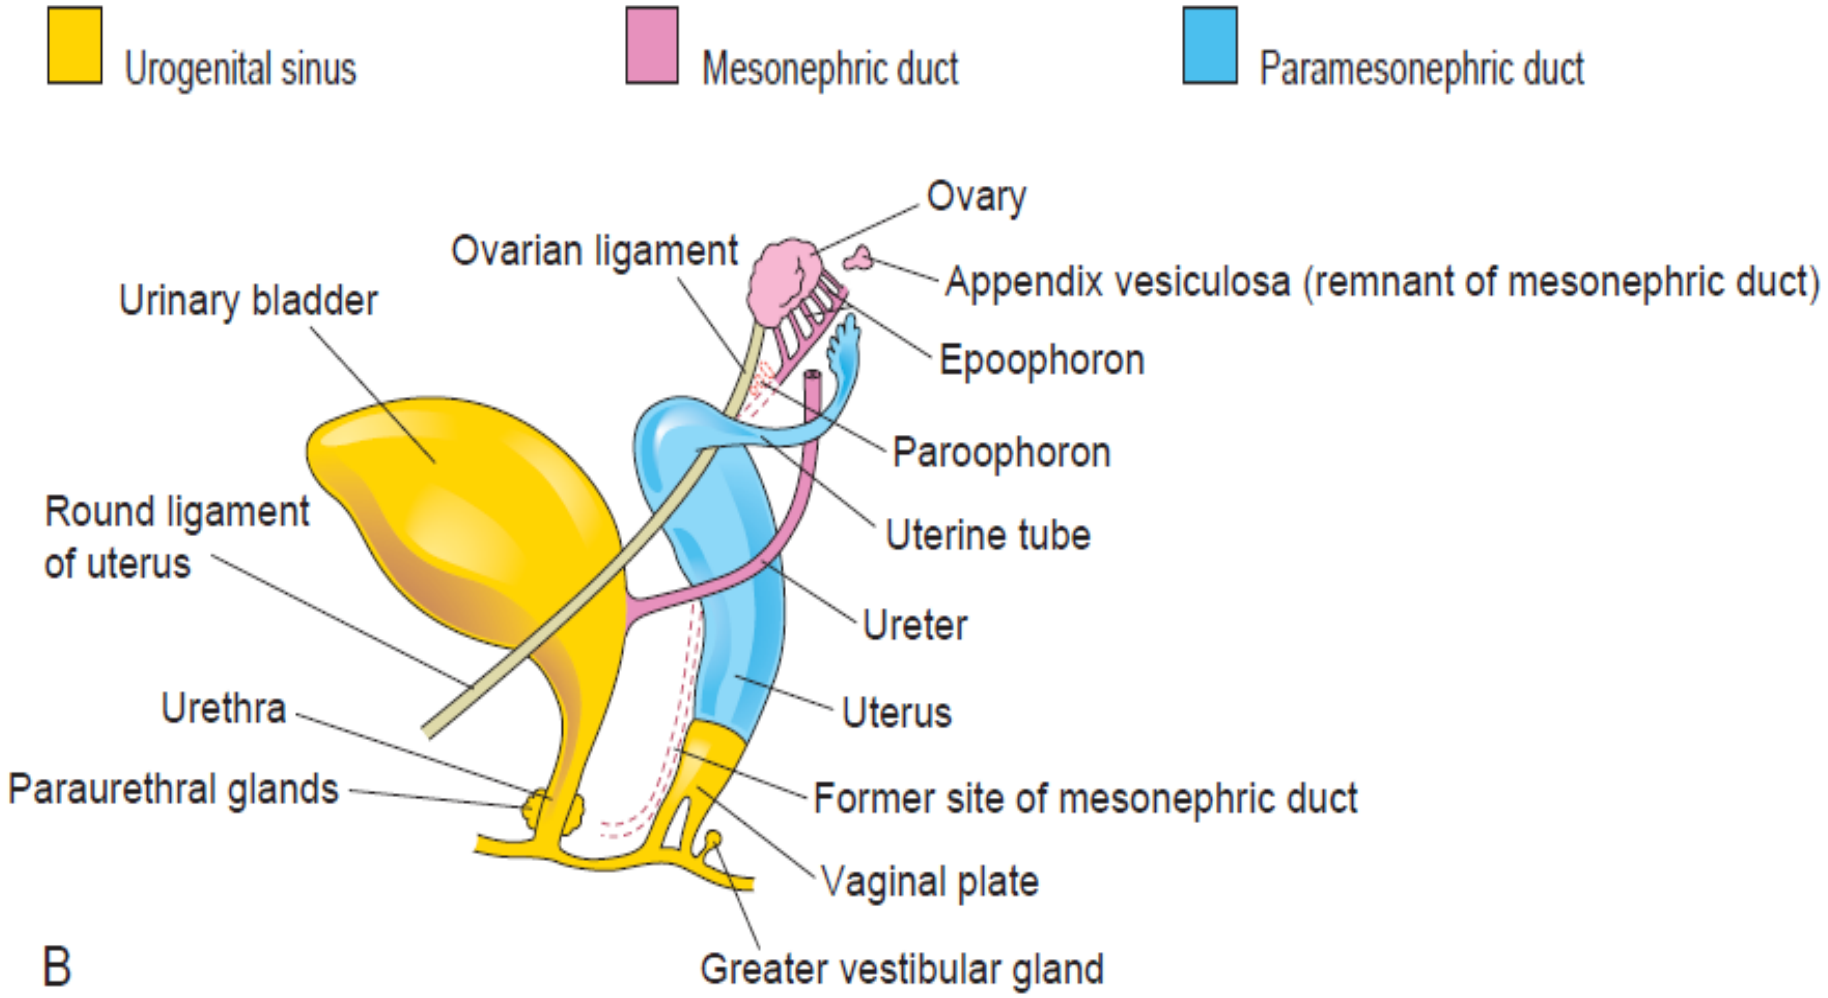

ALEXANDRIA NATIONAL UNIVERSITY

ANU MEDICAL SCHOOL PROGRAM

The caudal end of the uterovaginal canal causes Mullerian tubercle in the urogenital sinus that proliferates forming the sinovaginal bulb which proliferates to form the solid vaginal plate which will canalize and develops into the lower 2/3 of the vagina.
- Incomplete canalization at the caudal end of the vaginal plate leads to the formation of the hymen.
