Ureter

1- Abdominal part:

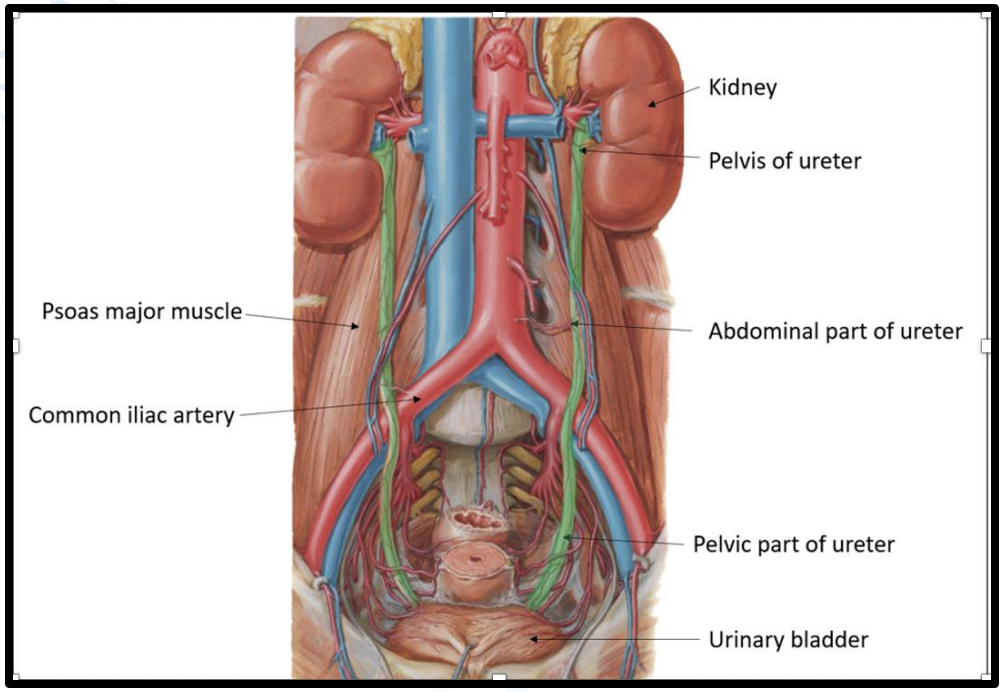

The renal pelvis is the funnel-shaped expanded upper end of the ureter. It lies within the hilum of the kidney. The ureter emerges from the hilum of the kidney and runs vertically downward behind the peritoneum on the psoas major muscle that separates it from the transverse processes of the lumbar vertebrae.

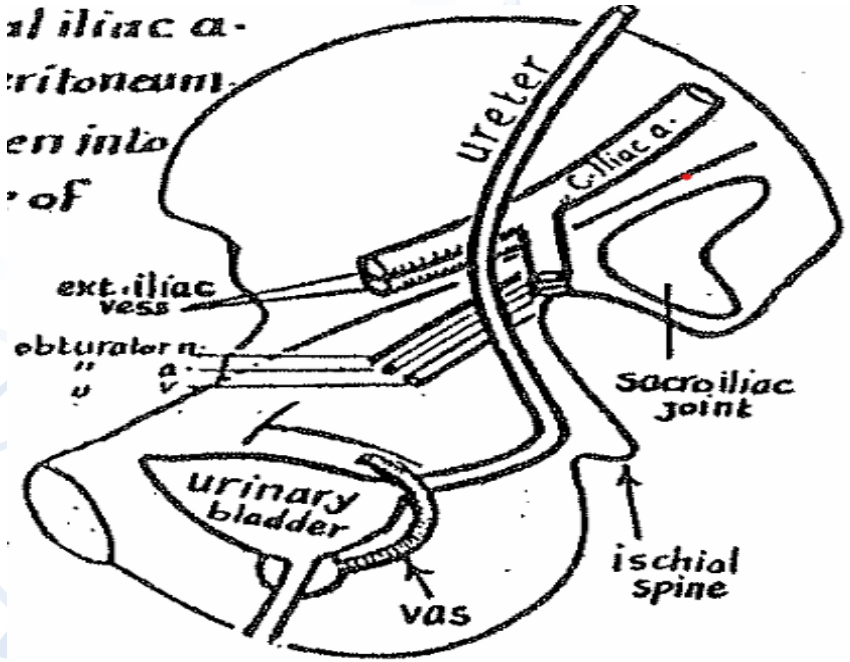

Ureter

2- Pelvic part:

It enters the pelvis by crossing the bifurcation of the common iliac artery. Then it runs down the lateral wall of the pelvis to the level of the ischial spine where it turns forward to enter the lateral angle of the bladder.

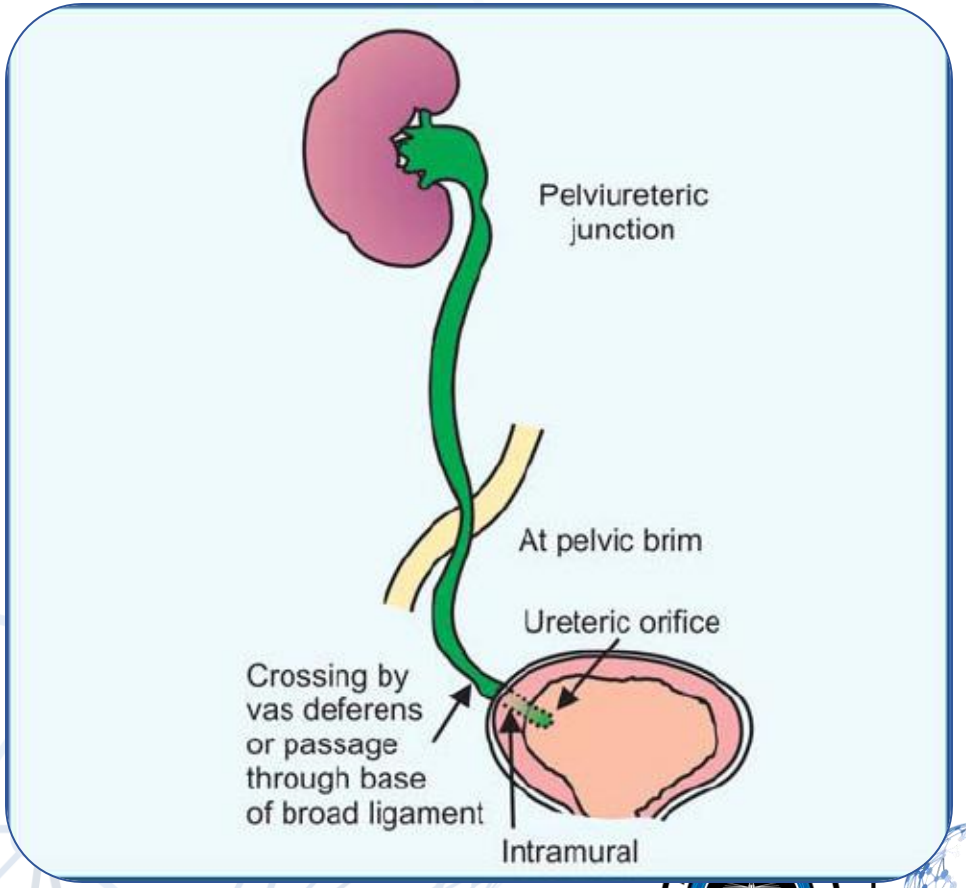

Ureter

3- Intramural part:

It runs obliquely through the wall of the bladder. The oblique course allows the opening of the ureter to act like a valve, preventing the back flow of urine from the bladder.
