Lect. 19 :The Female Mammary Gland (Breast) (Anat. 6)

Prof. Dr. Maha Diaa Safwat

Human Anatomy and Embryology Department

The Female Mammary Gland (Breast)

ILOs:

1- Relate the normal structure of the mammary gland to its clinical application.

2- Illustrate the blood supply of the mammary gland.

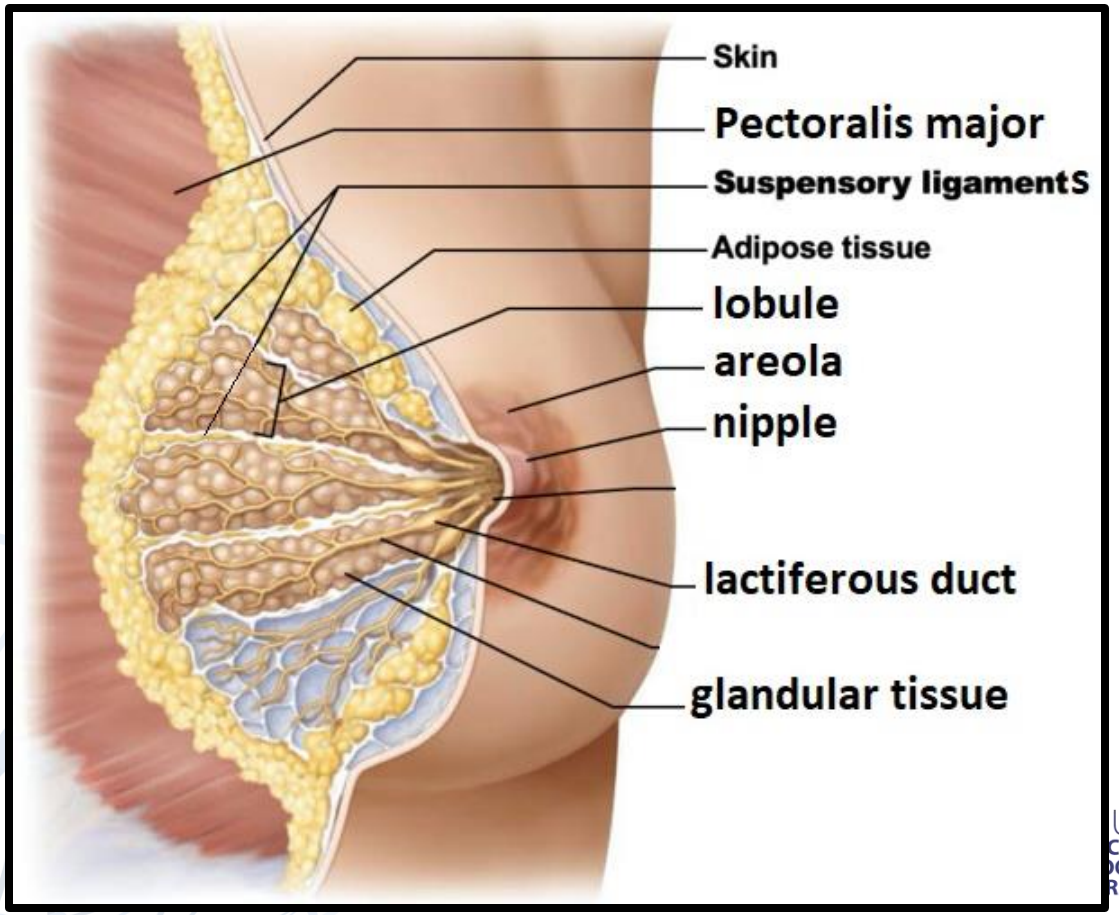

3- Appraise the clinical importance of the lymphatic drainage of the mammary gland.

4- Describe the developmental stages and abnormalities of the mammary gland.

ANU MEDICAL SCHOOL PROGRAM

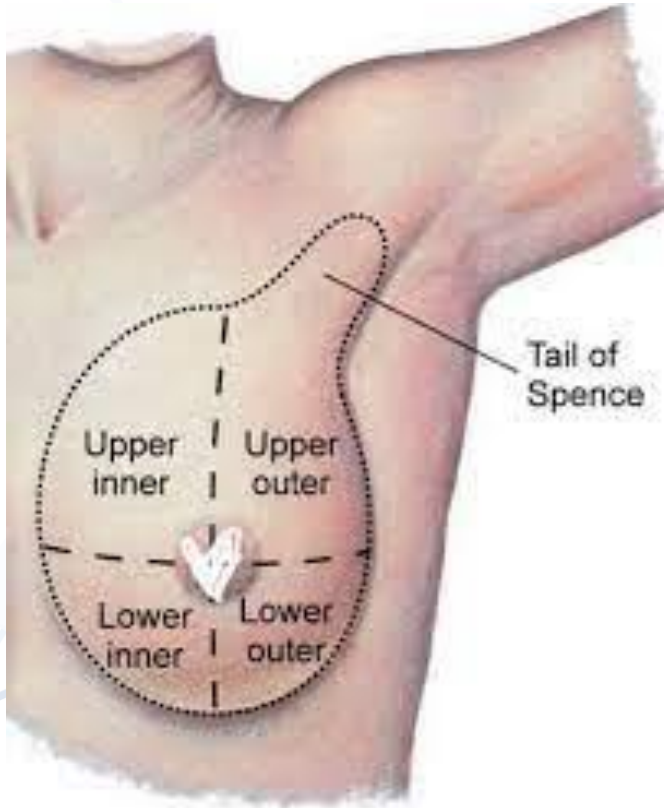

Definition

- it is a modified sweat gland concerned with milk secretion.
- It is formed of glandular tissue embedded in the superficial fascia of the pectoral region.

Shape

- Hemispherical and its upper lateral part has an extension into the axilla called axillary tail.
- The size, shape and contour are variable according to the age, body weight and lactating state.
- In males, the glandular tissue is rudimentary with scanty fat.
