Lobes of the prostate

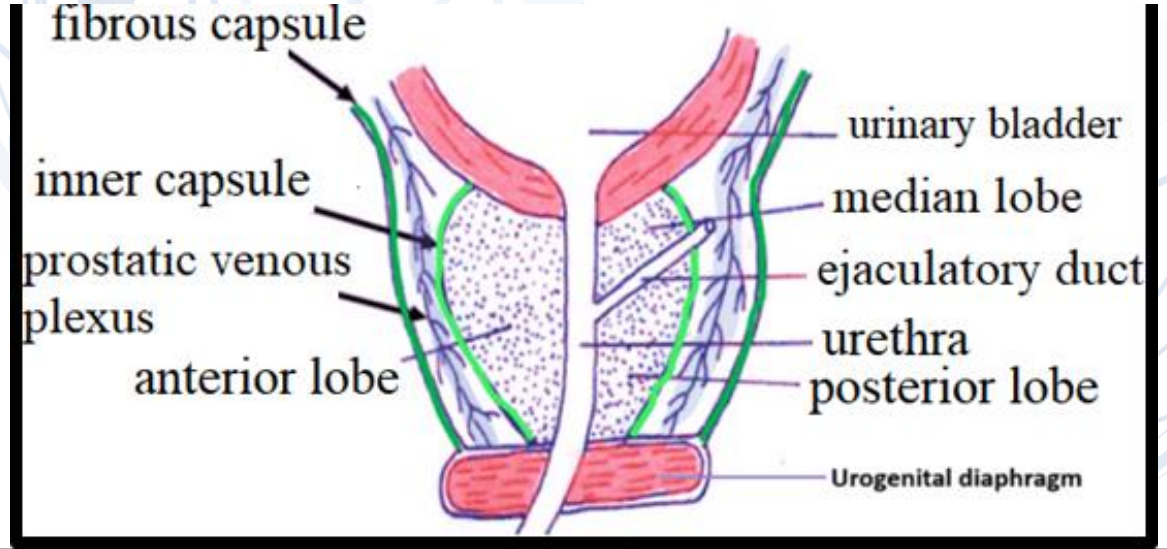

1- anterior lobe : lies anterior to the prostatic urethra. It is a fibromuscular part devoid of glandular tissue.

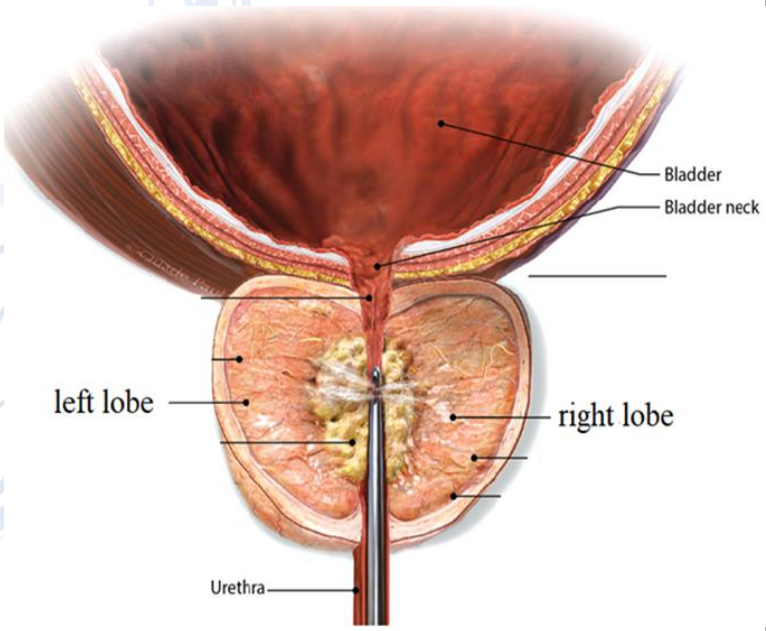

2- median lobe : lies above the 2 ejaculatory ducts and behind the prostatic urethra. It is the most glandular part.

3- posterior lobe : lies below the 2 ejaculatory ducts.

4- right lobe.

5- left lobe.

Coverings and blood supply of the prostate

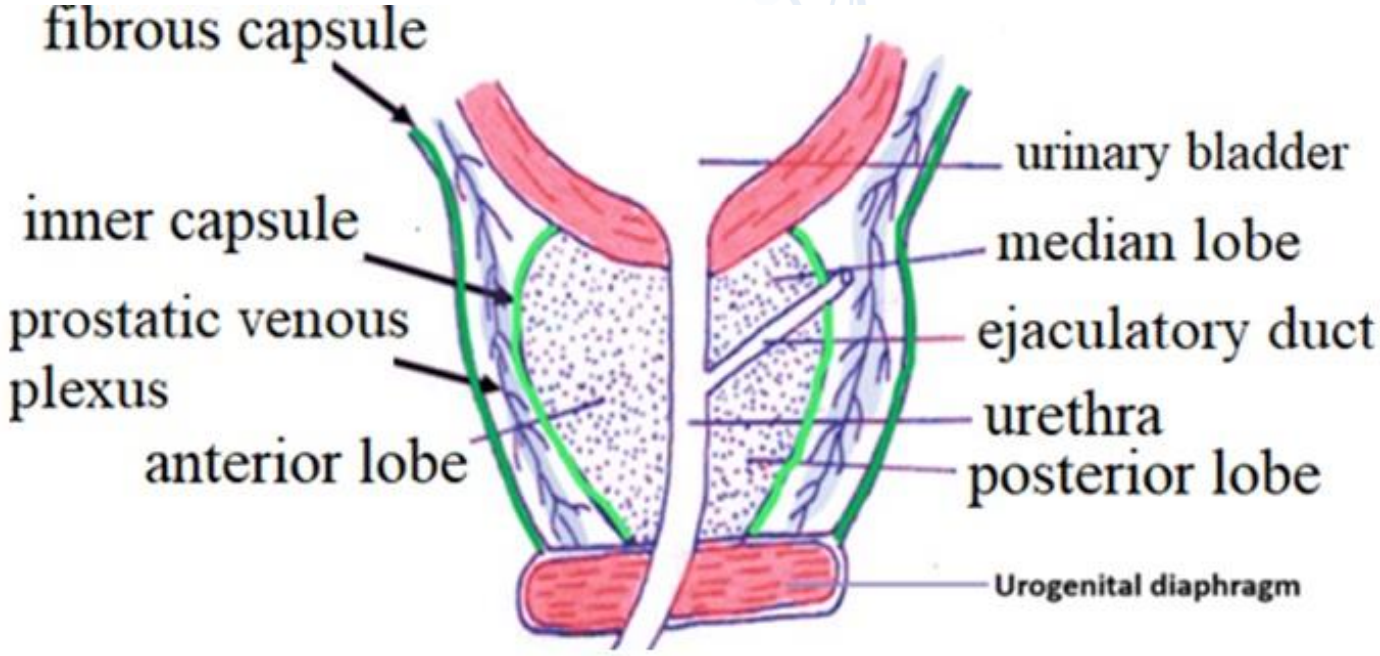

- **Coverings :** it is surrounded by:

a. inner true capsule. b. outer fibrous false capsule.

- **Arterial supply :** inferior vesical and middle rectal arteries.

- **Venous drainage :** Prostatic venous plexus (between the 2 capsules). The plexus drains into the internal iliac veins. The plexus communicates with the vesical venous plexus and vertebral venous plexus.

- **Lymphatic drainage :** internal iliac lymph nodes.

Clinical notes

- **benign prostatic hypertrophy :** the median lobe my undergo hypertrophy in old age and may press on the urethra with difficulty in micturition.

- It may elevate a part (uvula) inside the urinary bladder so that urine may accumulate behind it with recurrent infections.
