Bulbourethral glands

- They are 2 glands that lie on either side of the membranous urethra in the deep perineal pouch.
- They secrete a mucoid secretion and their ducts pierce the perineal membrane to open in the penile urethra.

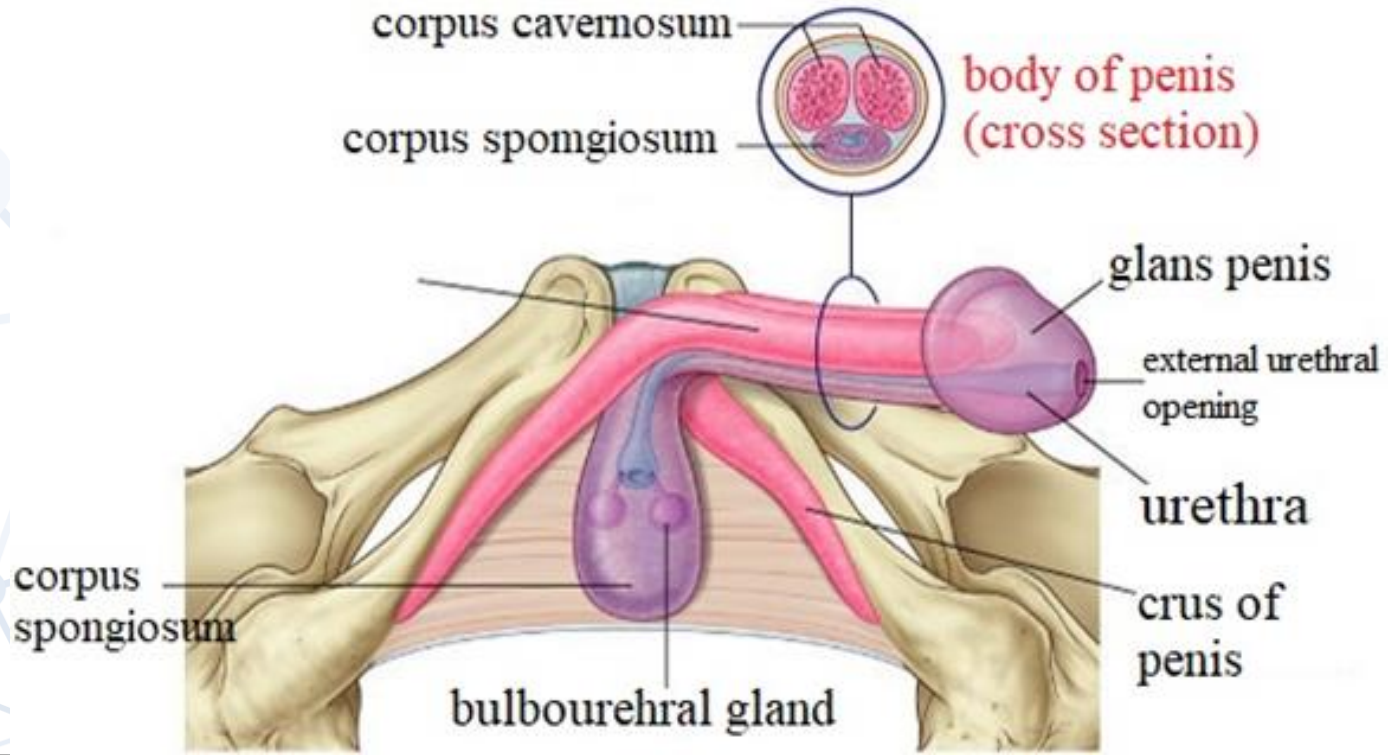

Penis

- The male genital organ. It is formed of root, body and glans.

1- Root of the penis : is formed of an enlarged part called bulb and 2 crura.

- The crura lie along the pubic arch.
- The bulb is pierced by the urethra.

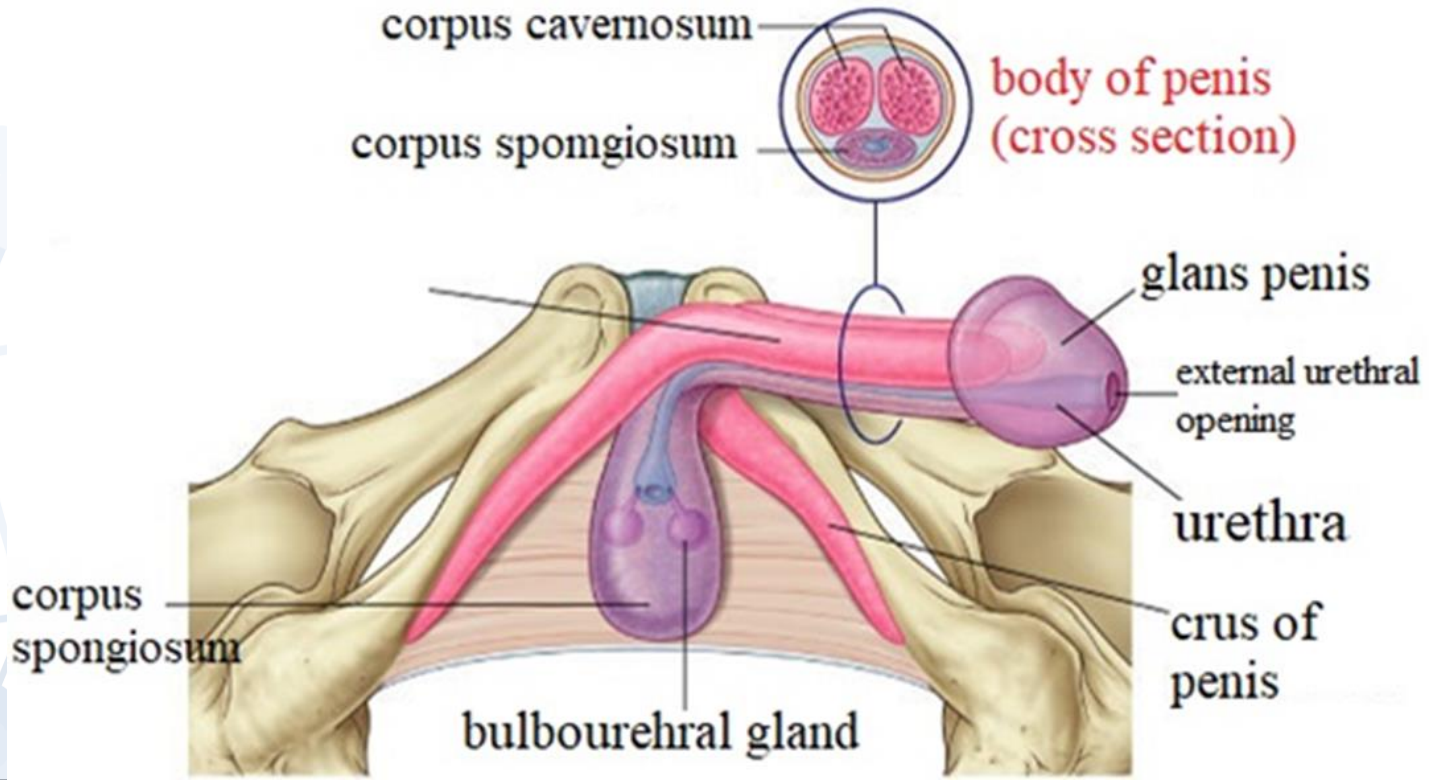

Penis

2- Body of the penis : is formed of three cylindrical masses (two corpora cavernosa and corpus spongiosum).

a. Corpus spongiosum : lies ventrally and is continuous with the bulb. It is expanded distally to form the glans penis. It contains the urethra.

b. 2 corpora cavernosa: lying dorsally and each is continuous with the corresponding crus

Penis

3- Glans penis : is the expanded distal part of the corpus spongiosum.

- Prepuce of the penis is a mucocutaneous fold covering the glans penis and is removed by circumcision.
