Peritoneal covering of the uterus

Peritoneal covering of the uterus

- The peritoneum is reflected from the upper surface of the urinary bladder at the isthmus to cover the lower surface of the body of the uterus forming the utero-vesical pouch.
- Then the peritoneum covers the fundus, the upper surface and continues downwards to cover the upper part of the posterior surface of the vagina and is reflected on the rectum forming the recto-vaginal (Douglas) pouch.
- Laterally, the peritoneum extends from the lateral wall of the uterus to the side wall of the pelvis forming a double layered fold called broad ligament.
