Ovary

- It has 2 ends :
- Tubal (upper) end : attached to fimbria of the uterine tube and suspensory ligament of the ovary.

- Uterine (lower) end : attached to the lateral angle of the uterus by the ligament of the ovary below and behind the opening of the uterine tube.

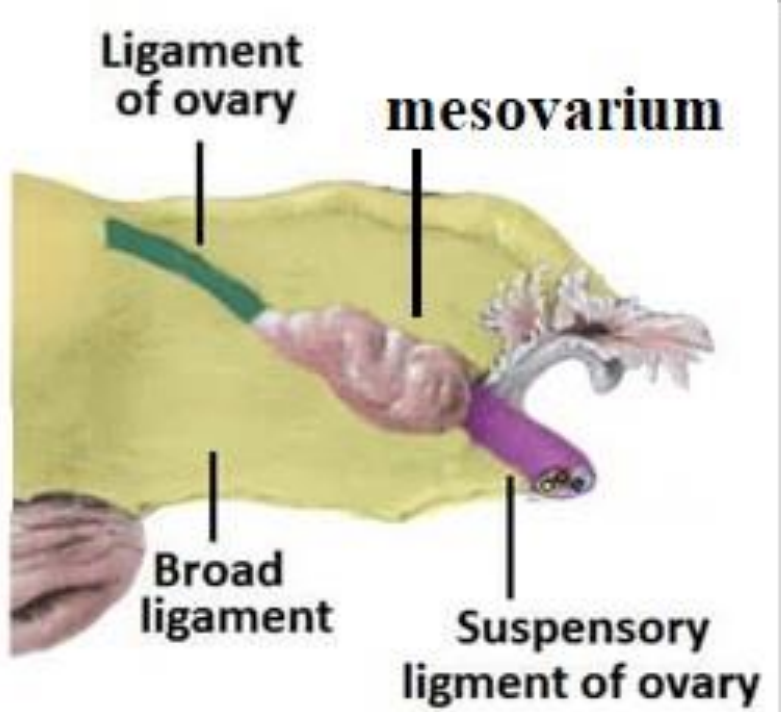

ALEXANDRIA NATIONAL UNIVERSITY
ANU MEDICAL SCHOOL PROGRAM

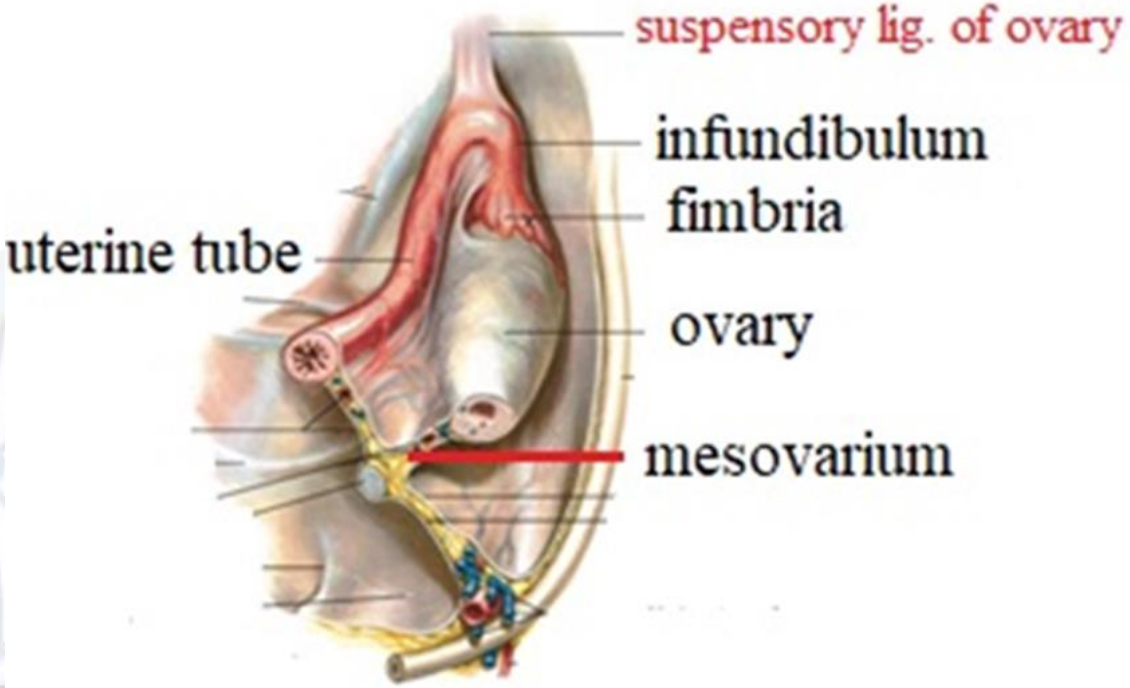

Ligaments of the ovary

1. Suspensory ligament : It connects upper end of ovary to the lateral pelvic wall and contains the ovarian vessels and nerves.

2. Ovarian ligament : It connects the uterine end of the ovary to the lateral angle of the uterus.

3. Mesovarium : It connects the anterior border of the ovary to the broad ligament.

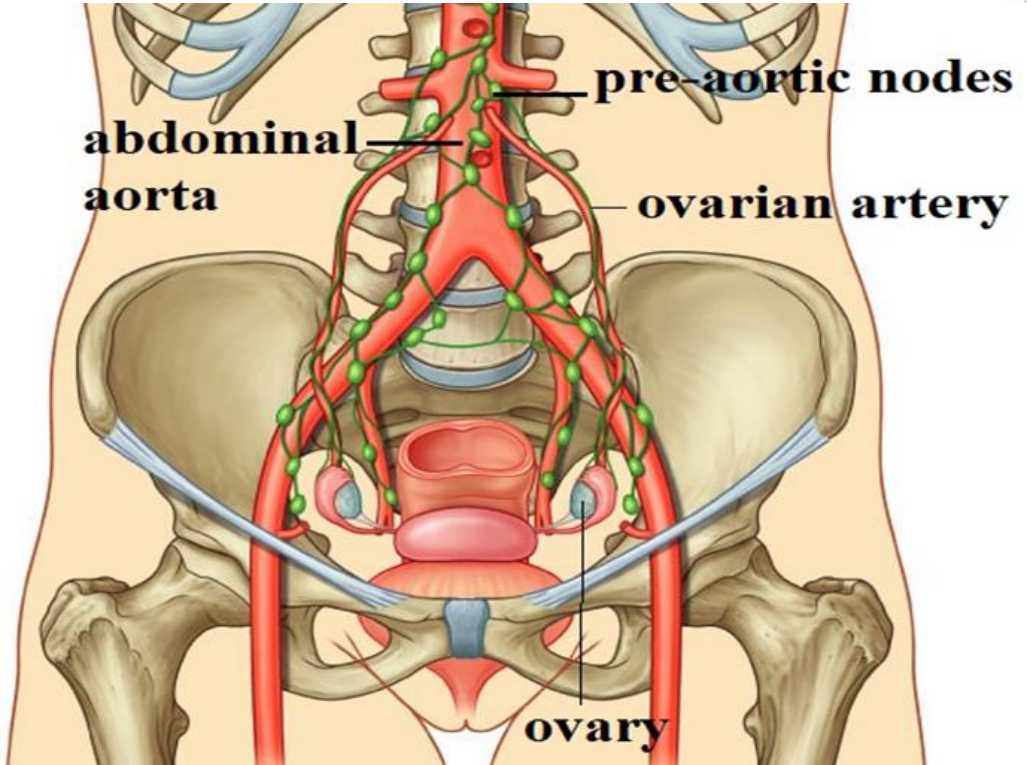

Arterial supply of the ovary

1- Ovarian artery : a branch of the abdominal aorta. It runs through the suspensory ligament then through mesovarium to reach the ovary.

2- Uterine artery : it gives few branches to the ovary.

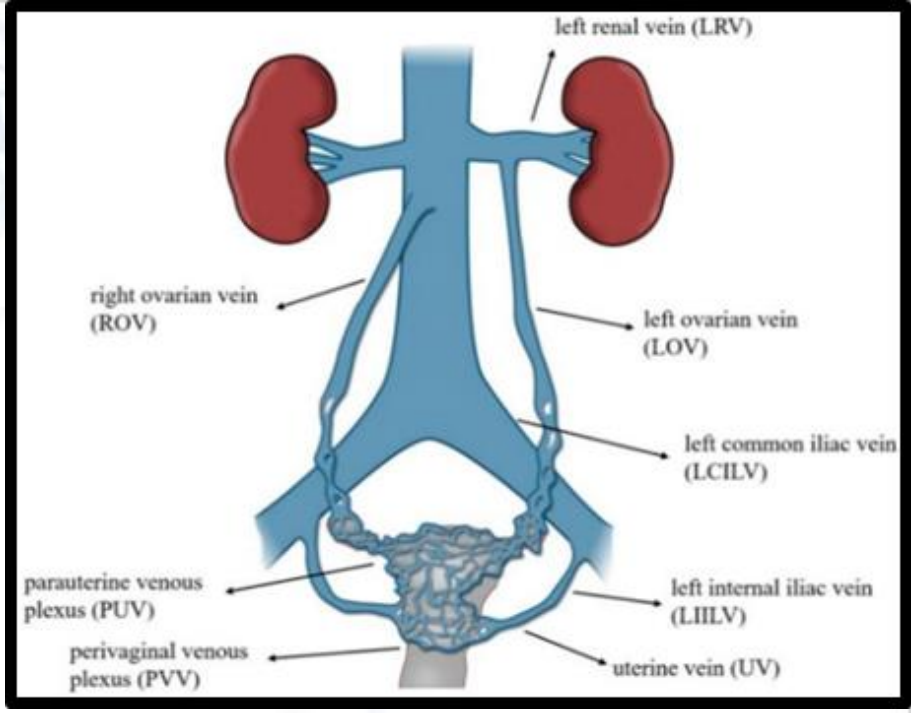

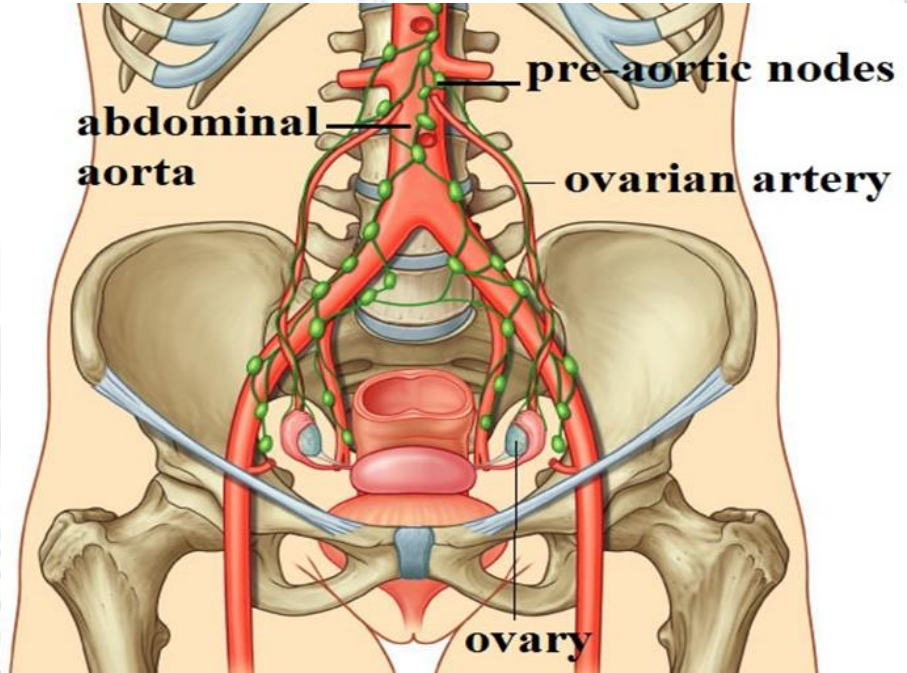

Venous & lymphatic drainage

- Venous drainage : by the pampiniform venous plexus that gives an ovarian vein.

- **The right ovarian vein** drains into inferior vena cava.
- **The left ovarian vein** drains into the left renal vein.

- Lymphatic drainage :
- It accompanies the ovarian vessels to reach the para-aortic lymph nodes at the level of L2.

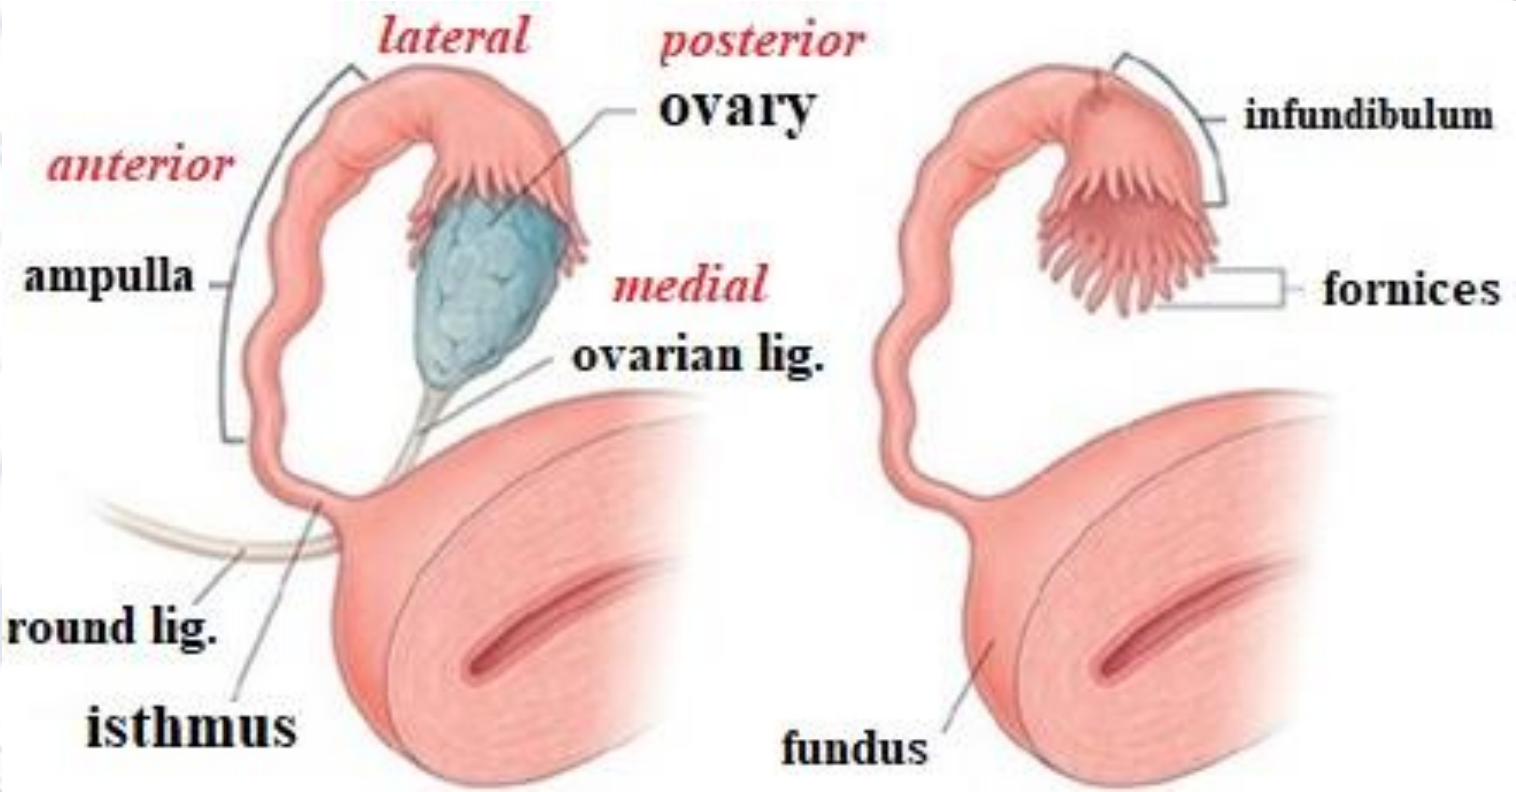

Uterine (Fallopian) tubes

- A muscular tube with great mobility. Its lateral end opens into the peritoneal cavity while the medial one opens into the uterus at the cornu.

- **Function :** Transportation of oocytes by peristaltic movement and the action of its cilia.

Parts of the uterine tubes

1- Intramural part : that lies inside the muscular wall of the uterus.

2- Isthmus : is the medial part. It is the narrowest part.

3- Ampulla : is the site of fertilization of the ova.

4- Infundibulum : funnel-shaped and gives the fimbria which are finger-like processes around the lateral opening that lead the ovum after ovulation to the lateral opening of the tube.
