Greater vestibular glands

- They are pea-shaped mucous glands that lie deep to the labia majora.

- Their ducts open in the vestibule of the vagina lateral to the vaginal orifice.

- **Function :** they produce secretion during sexual arousal.

- Clinical notes : infection of these glands leads to ‘Bartholin Abscess’.

Test your self

- True or false :

1. Ovary is attached to the broad ligament by mesovarium. **T**

2- Left ovarian vein drains into the inferior vena cava. **F**

3- Infundibulum of Fallopian tube is the site of fertilization of ova. **F**

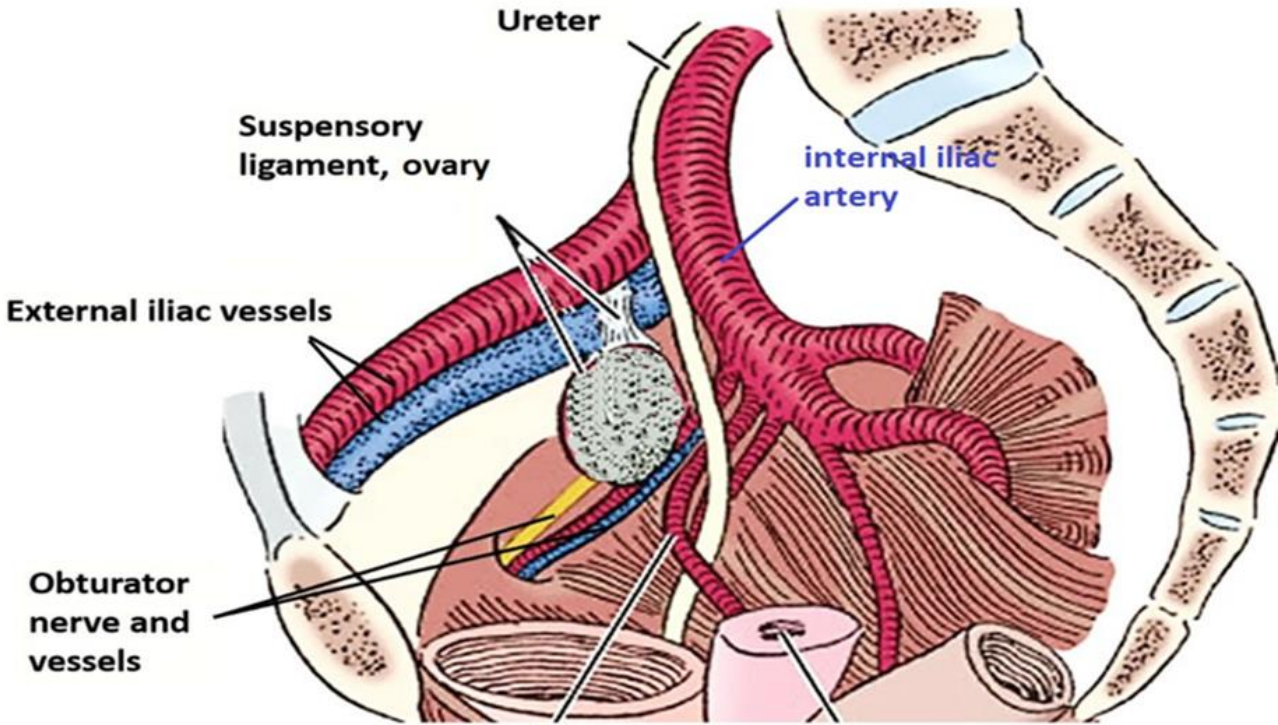

4- Greater vestibular glands li deep to the labia majora. **T**

Test your self

- Which structure forms the posterior border of the ovarian fossa?

A. Obturator nerve.
B. Ureter.
C. External iliac artery.
D. Broad ligament.

Ureter
