Structure of the mammary gland

1. **Glandular tissue** which is divided into lobules by fibrous septa called suspensory ligaments. The ligaments extend from the deep fascia to the skin and help to support the breast tissue. A lactiferous duct arises from each lobule. The lactiferous ducts run in a radial direction to open on the nipple.
2. **Fatty tissue** into which the glandular tissue is embedded.
3. **Nipple:** is a protrusion on which the lactiferous ducts open.
4. **Areola:** a pigmented area of skin surrounding the nipple.

Arterial supply

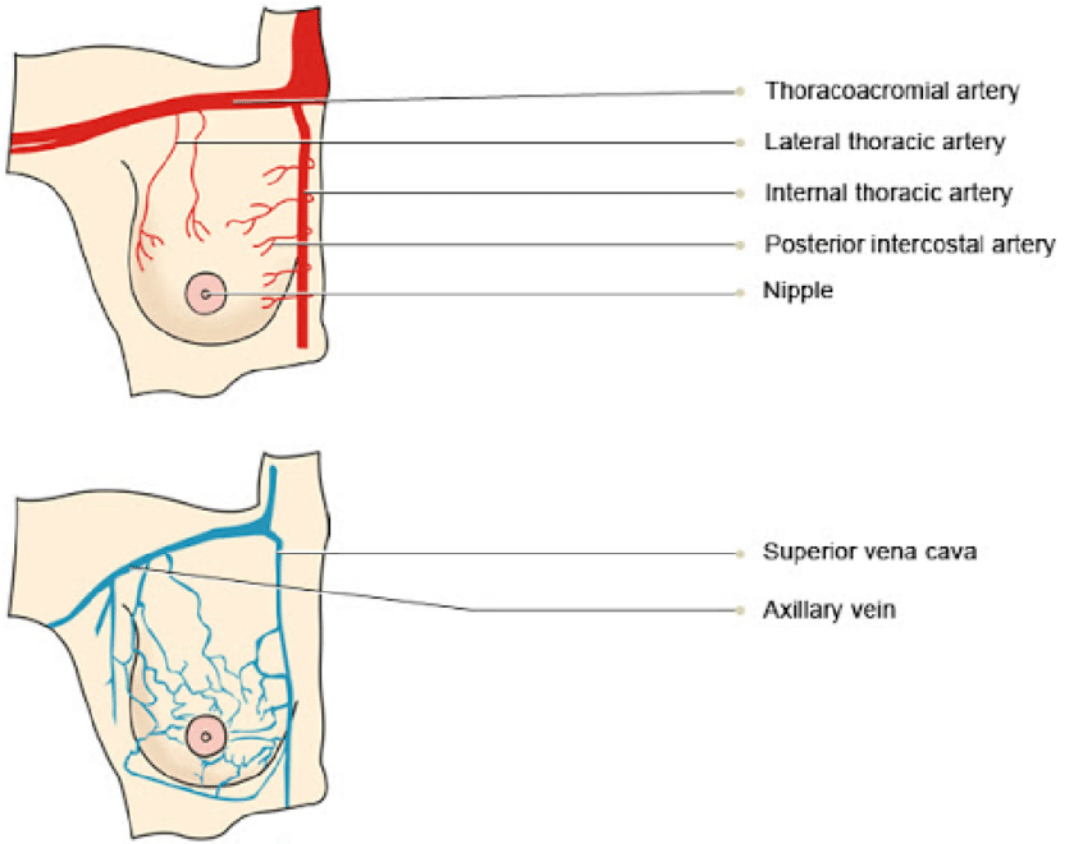

1. Perforating branches of internal thoracic artery.
2. Anterior intercostal arteries.
3. Lateral thoracic and thoraco-acromial branches of the axillary artery.

PROGRAM

Venous drainage

Into the veins accompanying the supplying arteries.
