Male reproductive system

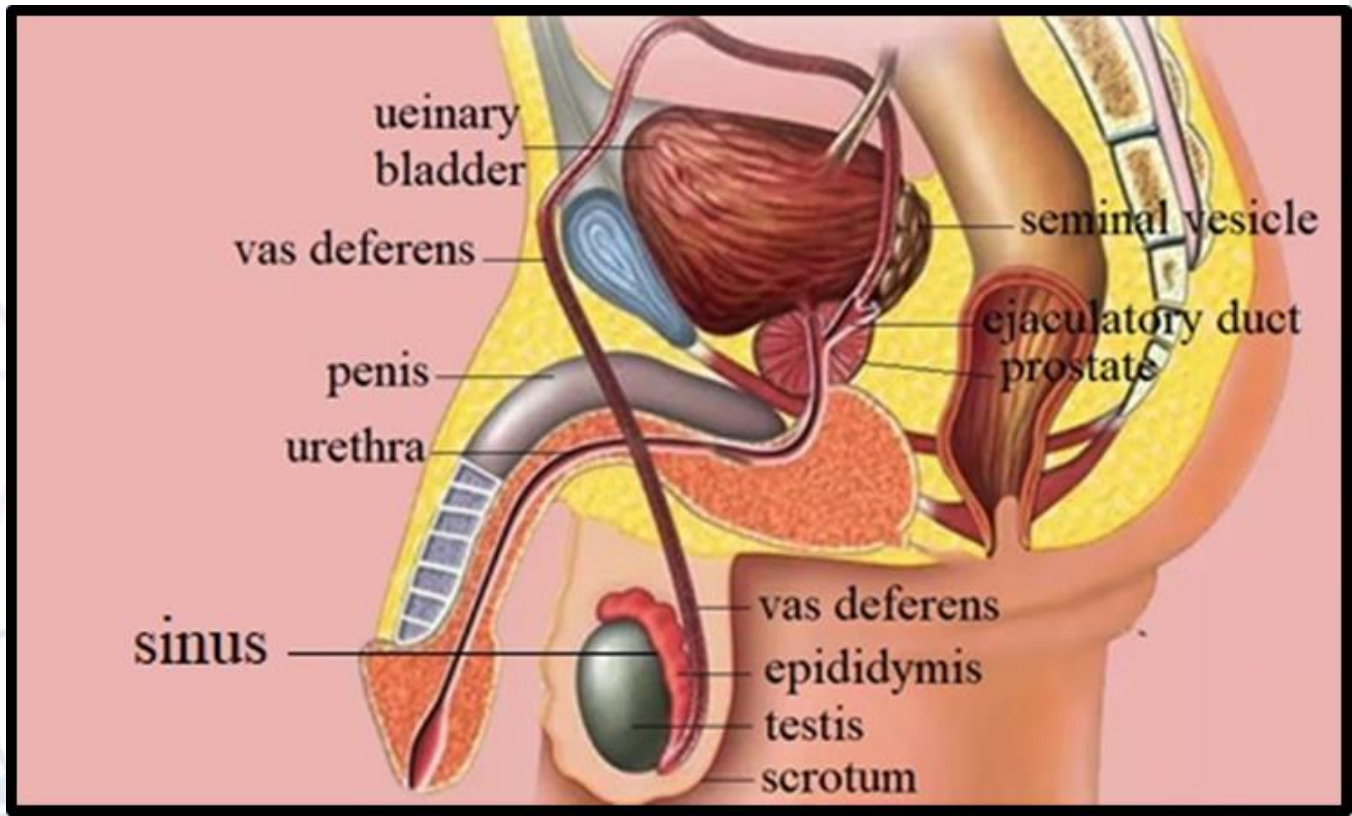

Prof. Dr. Abdelghany Hassan Abdelghany
Professor of Anatomy and Embryology
Faculty of Medicine, Alexandria University

Testis

- **Site :** in the scrotum. The temperature inside the scrotum is lower than the normal body temperature as spermatogenesis needs a lower temperature.

- **Functions :**

1- production of sperms.
2- production of testosterone.

Testis

- The testis has a covering called tunica albuginea which is thickened posteriorly forming the mediastinum.
- The testis is connected with canals inside the mediastinum called the rete testis which are connected to the epididymis by

efferent ductules.

- The testis invaginates a sac called

tunica vaginalis so that it becomes

covered by an inner (visceral)

layer and an outer (parietal layer) of

tunica vaginalis.
