Blood and nerve supply of the testis

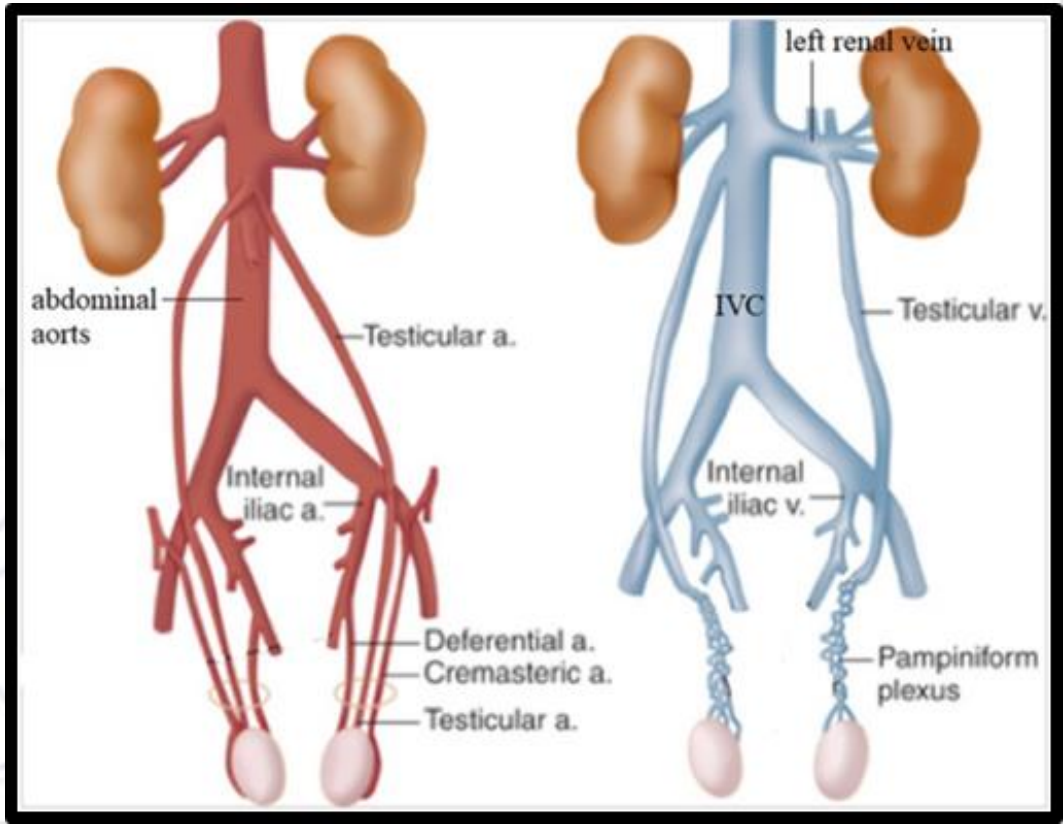

- **Arterial supply :** testicular artery originating from the abdominal aorta.

- **Venous drainage :** veins form pampiniform plexus of veins that gives a testicular vein. The right vein drains into IVC

while the left vein drains into the left renal vein.

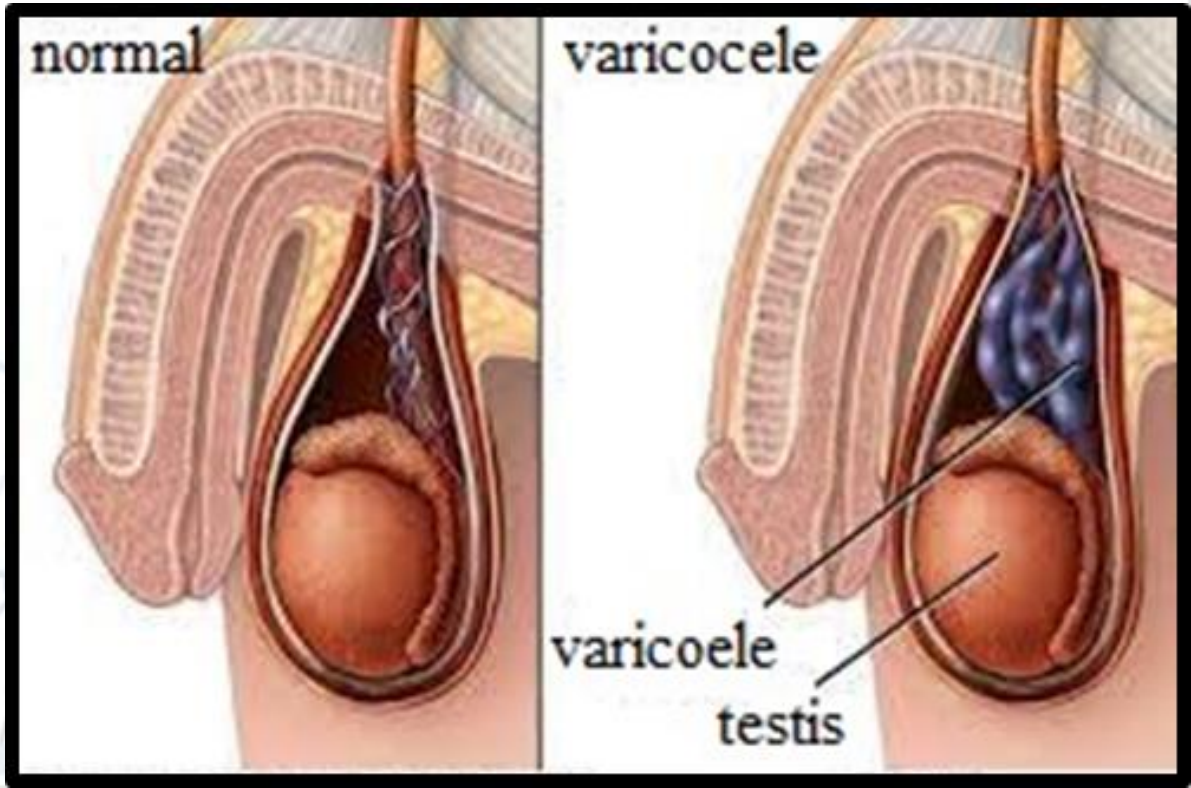

- **Lymphatic drainage :** para-aortic lymph nodes.

- **Nerve supply:** sympathetic supply (T 10).

Clinical notes

- **Varicocoele:**
- Enlarged dilated tortuous veins of the pampiniform venous plexus.
- It is more common on the left side as the left testicular vein opens in the left renal vein at a right angle that impedes the venous return.
- The right testicular vein opens in the inferior vena cava at an acute angle with better venous return.
- **Varicocele** gives the sensation of a bag of worms inside the scrotum. It is treated surgically.

Scrotum

- It is the sac into which the 2 testes lie. It is divided by a septum into 2 compartments.
- It has :

1- thin dark skin.

2- dartos muscle (replacing the fatty layer of superficial fascia) that contracts giving the scrotum its wrinkled appearance.

3- membranous layer (Colle's fascia).
