Symphysis pubis

- It is the joint between the bodies of the pubic bones with an intervening disc.

- Type : secondary cartilaginous joint.

Sacroiliac joint

-It has 2 compartments :

1- Anterior part : between the auricular surfaces of the ilium and sacrum. It is a synovial plane joint permitting sliding movements.

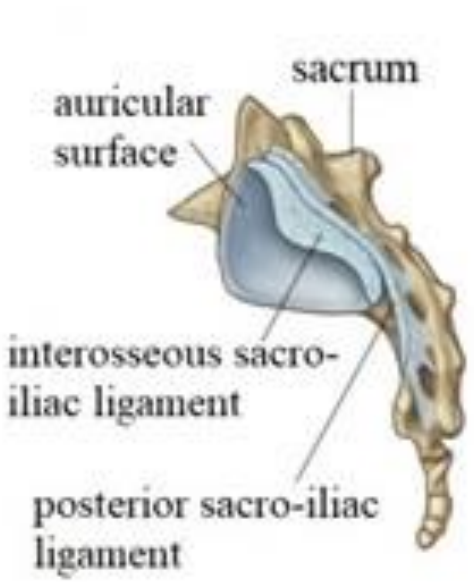

2- Posterior part : between the tuberosities of the bones. It is a fibrous joint (syndesmosis). It has a limited mobility.

- Ligaments :

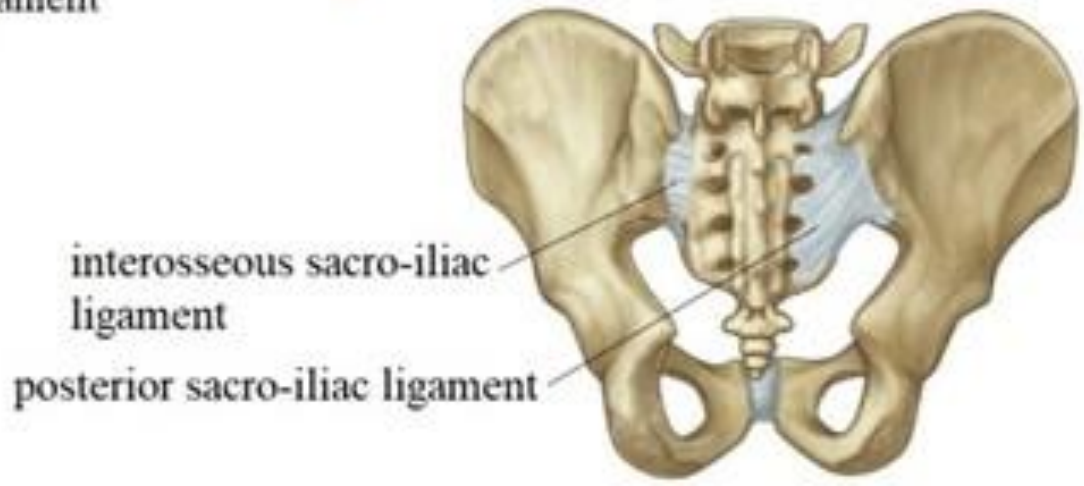

1- Anterior sacroiliac ligament.

2- Interosseous sacroiliac ligament.

3- Posterior sacroiliac ligament .

Sacrotuberous and sacrospinous ligaments

- Sacrotuberous ligament extends between the side of sacrum and coccyx to the ischial tuberosity.

- Sacrospinous ligament extends between the side of sacrum and coccyx to the ischial spine.

- They convert the greater and lesser sciatic notches into foramina.
