Organization of pelvic viscera in males

- Urinary bladder is the most anterior organ and the urethra extends from its lower end.
- Prostate gland lies below the urinary bladder.
- Rectum lies most posteriorly.

Peritoneal reflections in the male pelvis

- The peritoneum passes from the inner aspect of the anterior abdominal wall to the upper surface of the urinary bladder and the upper part of its posterior surface to be reflected on the rectum forming the rectovesical pouch.

Organization of pelvic viscera in females

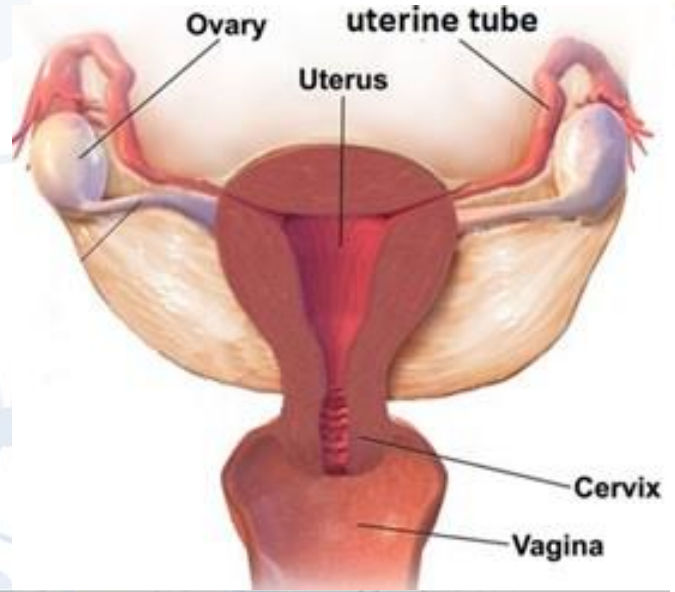

- Urinary bladder is the most anterior organ and the urethra extends from its lower end.
- Uterus lies above the urinary bladder while its lower part (cervix) lies behind the bladder.
- Vagina extends from the uterus

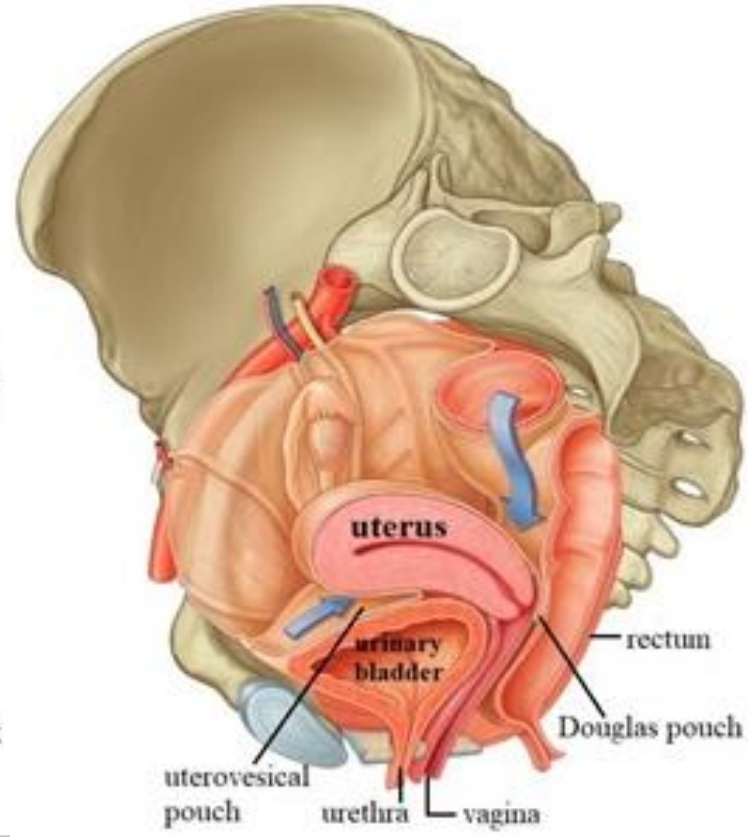

and lies behind the urinary bladder.

- Rectum lies most posteriorly.
- On each side, a uterine tube

opens in the side of the uterus

and ends at the ovary.

Peritoneal reflections in the female pelvis

- The peritoneum passes from the inner aspect of the anterior abdominal wall to the upper surface of the urinary bladder to be reflected on the lower surface of the uterus forming the uterovesical pouch.

- Then, it covers the upper surface of the uterus and the posterior aspect of the vagina to be reflected on the rectum forming the rectovaginal (rectouterine) or Douglas pouch.
