The Kidney

Fibrous capsule: This surrounds the kidney and is closely applied to its outer surface.

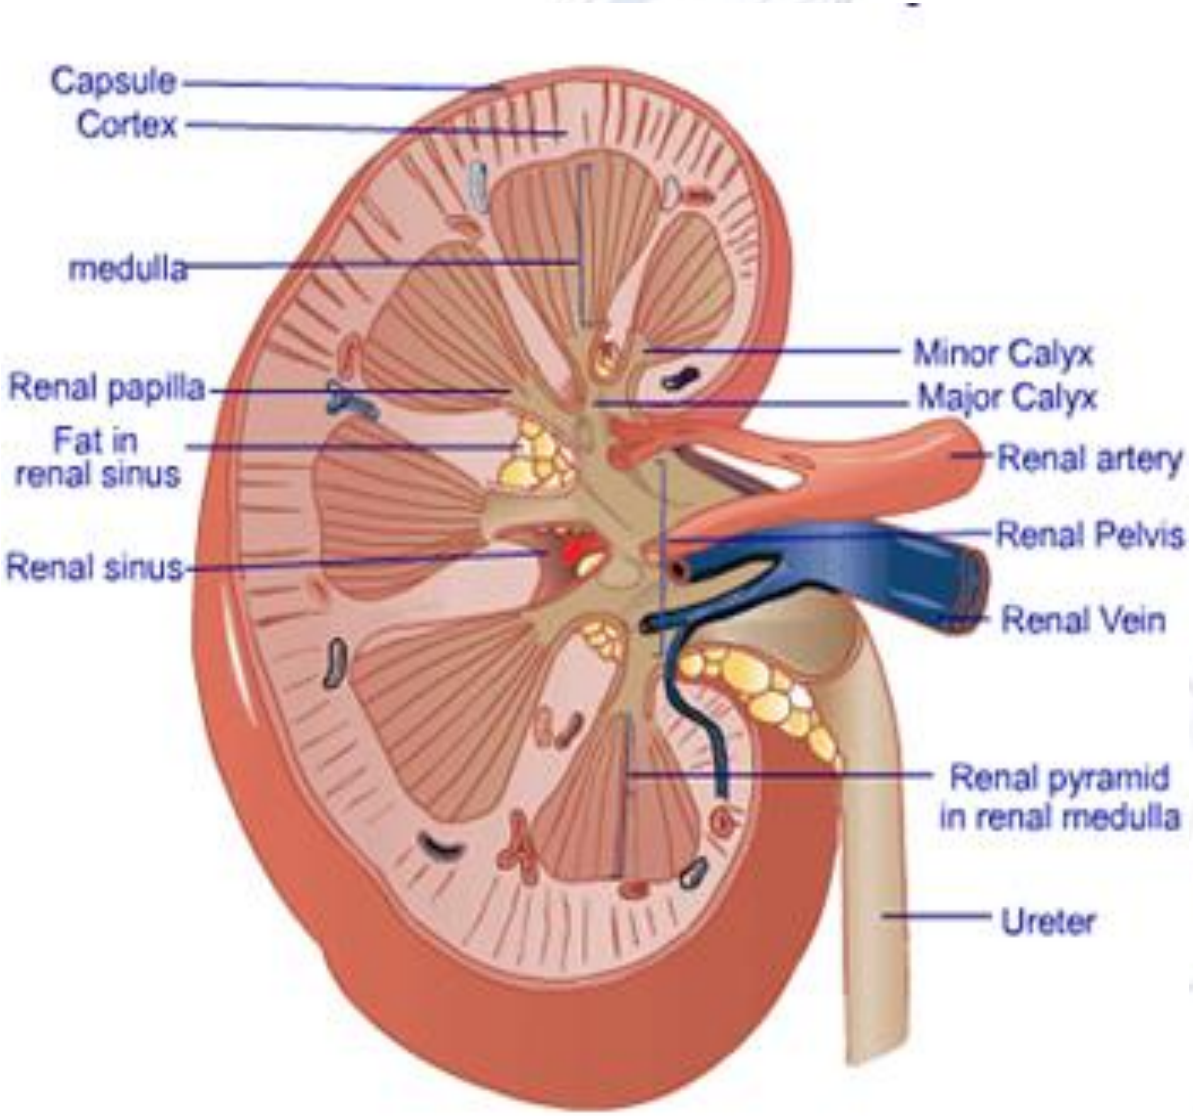

Perinephric fat: This covers the fibrous capsule.

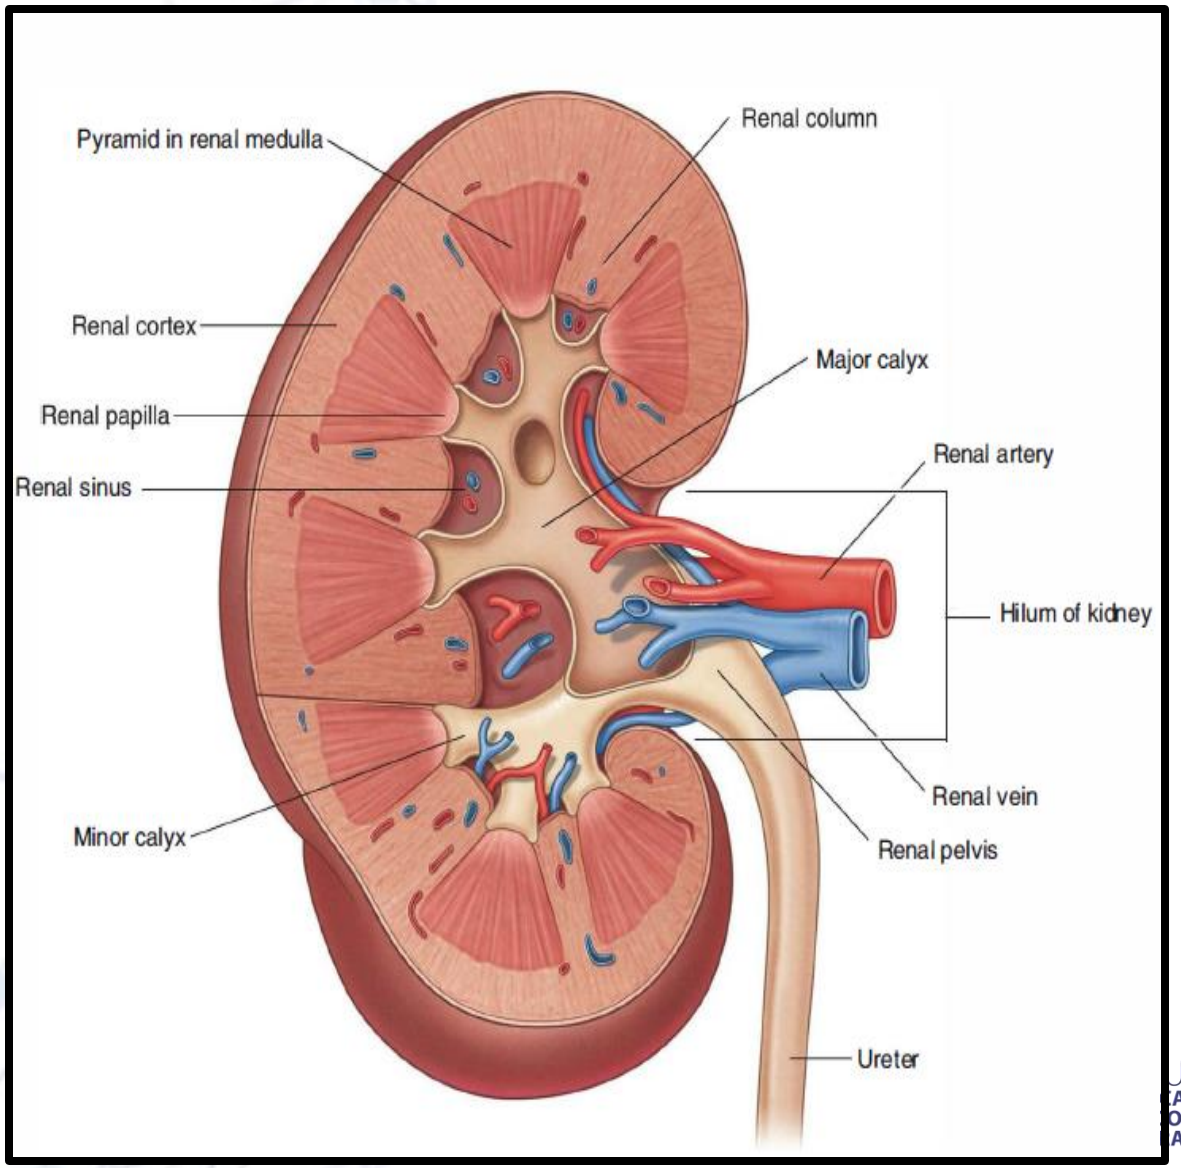

Renal fascia: This is a condensation of connective tissue that lies outside the perinephric fat and encloses the kidneys and suprarenal glands.

Paranephric fat: This lies external to the renal fascia. The pararnephric fat supports the kidneys and holds them in position on the posterior abdominal wall.

Internal structure of the kidney :

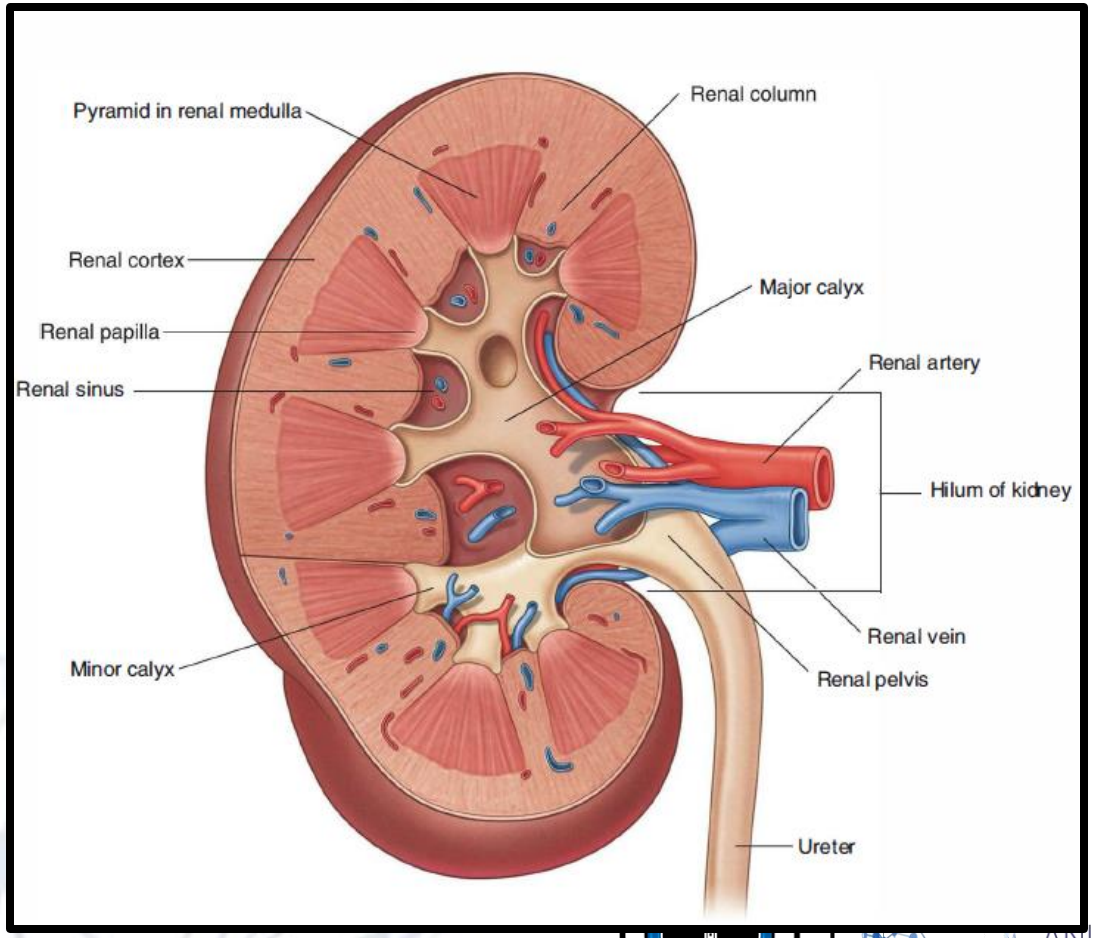

The Kidney

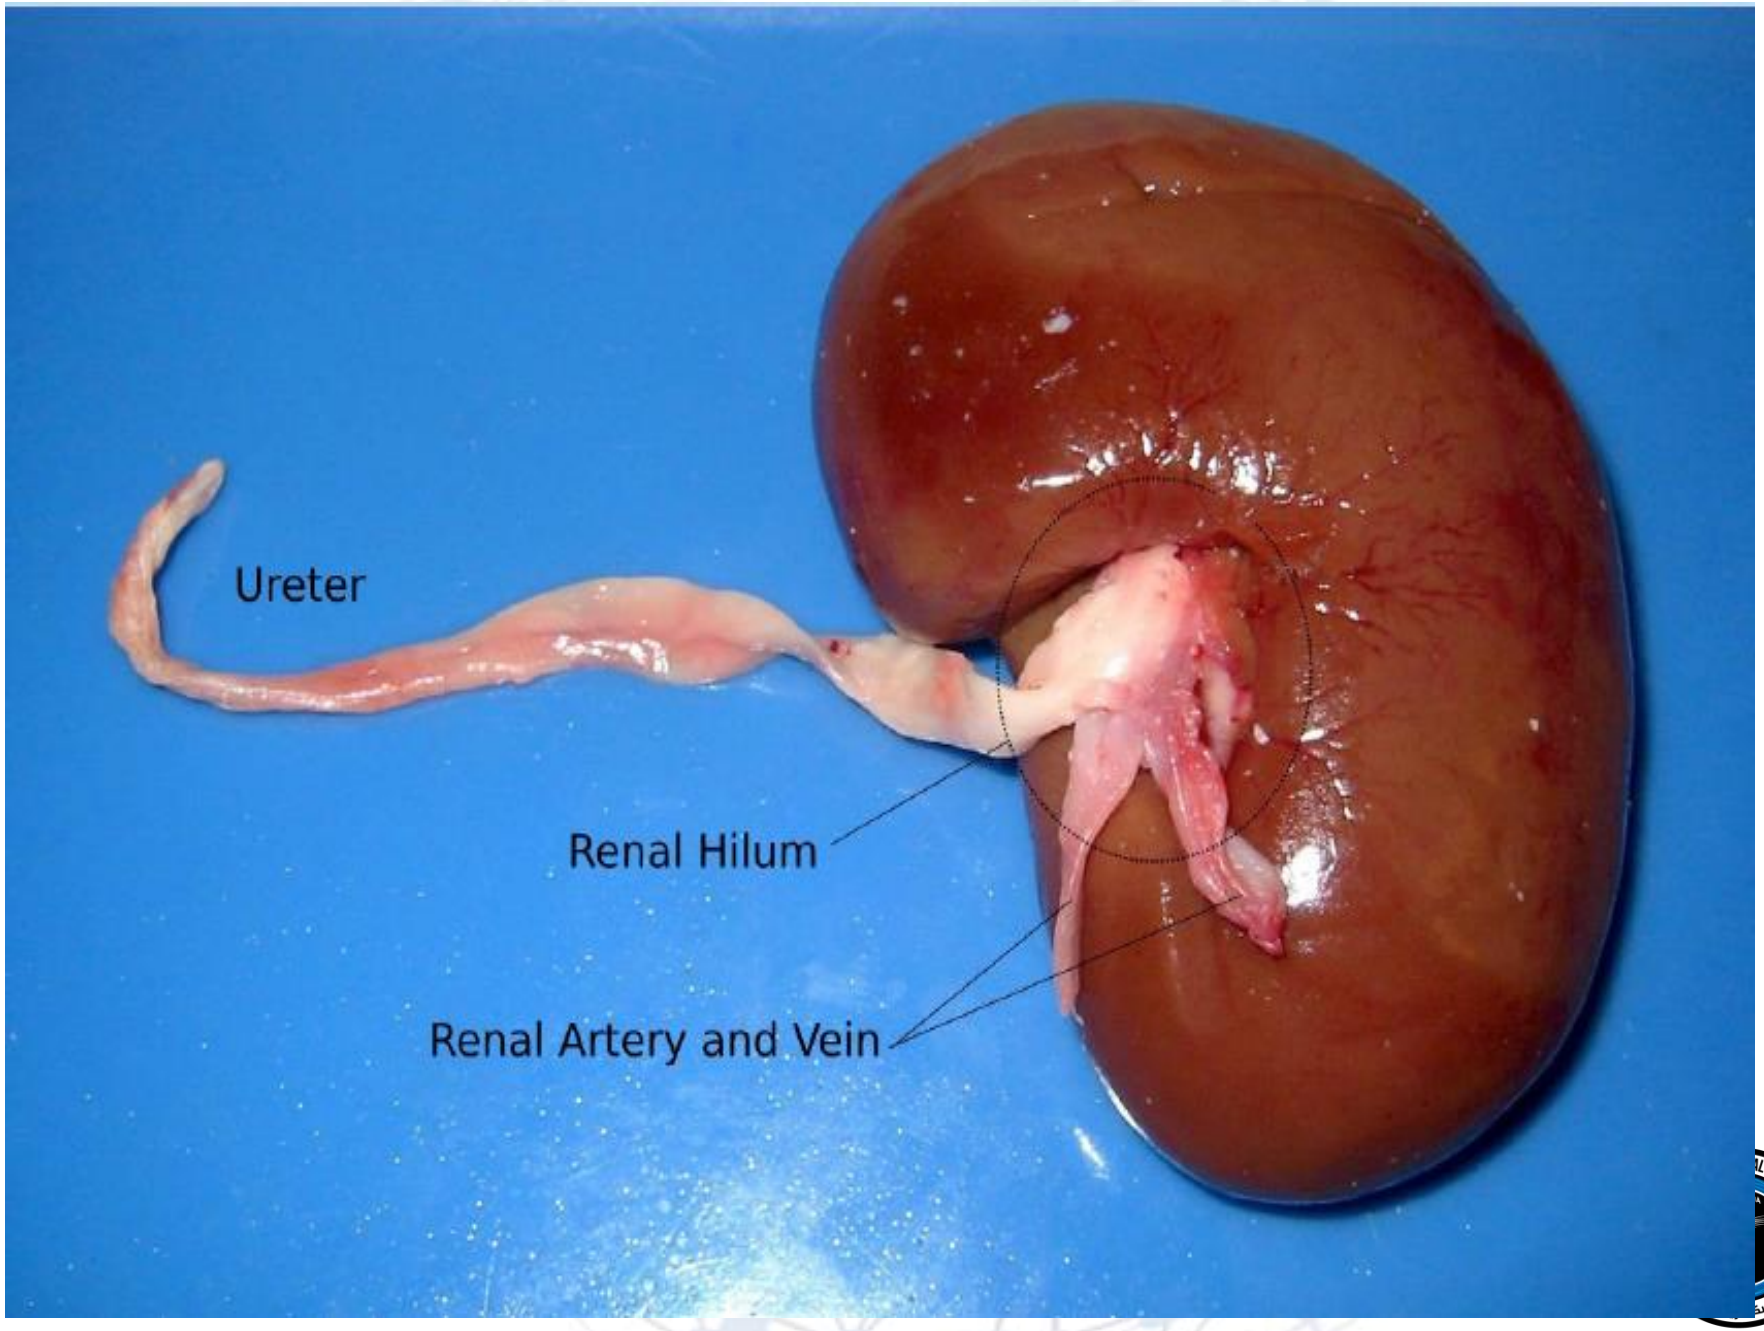

Internal structure of the kidney : The kidney is made up of an outer cortex and an inner medulla.

The cortex: the outer region of the kidney that sends the renal columns between the pyramids of the medulla.

The medulla: the inner part and is made up of renal pyramids that open into the minor calyces. The minor calyces open in major calyces that join to form the renal pelvis which is the upper part of the ureter.
