Development of the kidney
Congenital anomalies

1) Renal agenesis:

-Unilateral or bilateral absence of kidney.

It is always associated with oligohydraminos.

Cause: non development or degeneration of the ureteric bud or non-contact between ureteric bud and metanephric cap.

Development of the kidney
Congenital anomalies

3) Pelvic kidney:

Cause: It is due to failure of the kidney to ascend to the abdomen where it is kept in the pelvis.

Development of the kidney
Congenital anomalies

4) Horseshoe kidney:

- Cause: It occurs when the lower poles of both kidneys fuse together and this makes the kidneys fail to ascend.
