Lect. 54 : Development of the urinary bladder and urethra (Anat. 15)

Prof. Dr. Maha Diaa Safwat

Human Anatomy and Embryology Department

Development of the urinary bladder and urethra

ILOs:

1- Interpret the successive stages of development of the urinary bladder and different parts of the urethra.

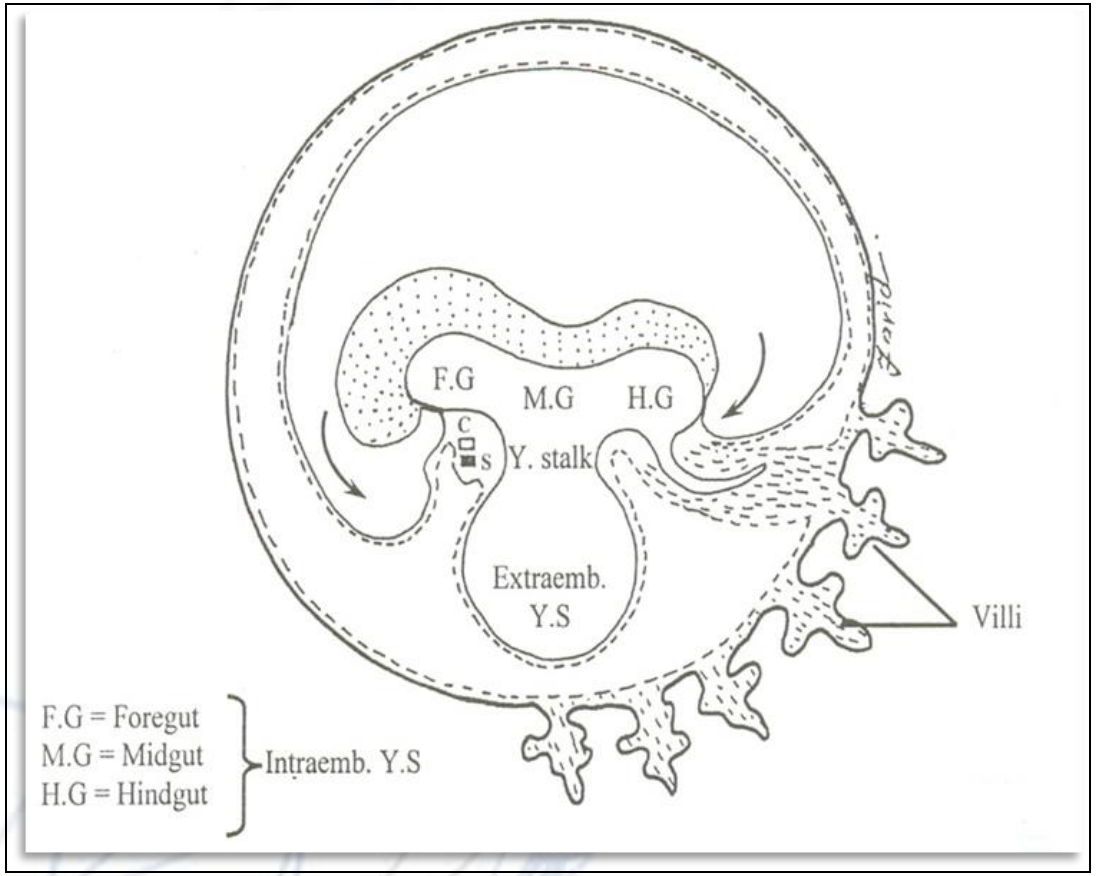

2- Relate the congenital anomalies of the urinary bladder and urethra to their developmental process.

3- Relate the congenital anomalies of the urinary bladder and urethra to their embryological origin.

ANU MEDICAL SCHOOL PROGRAM

Development of Urinary Bladder

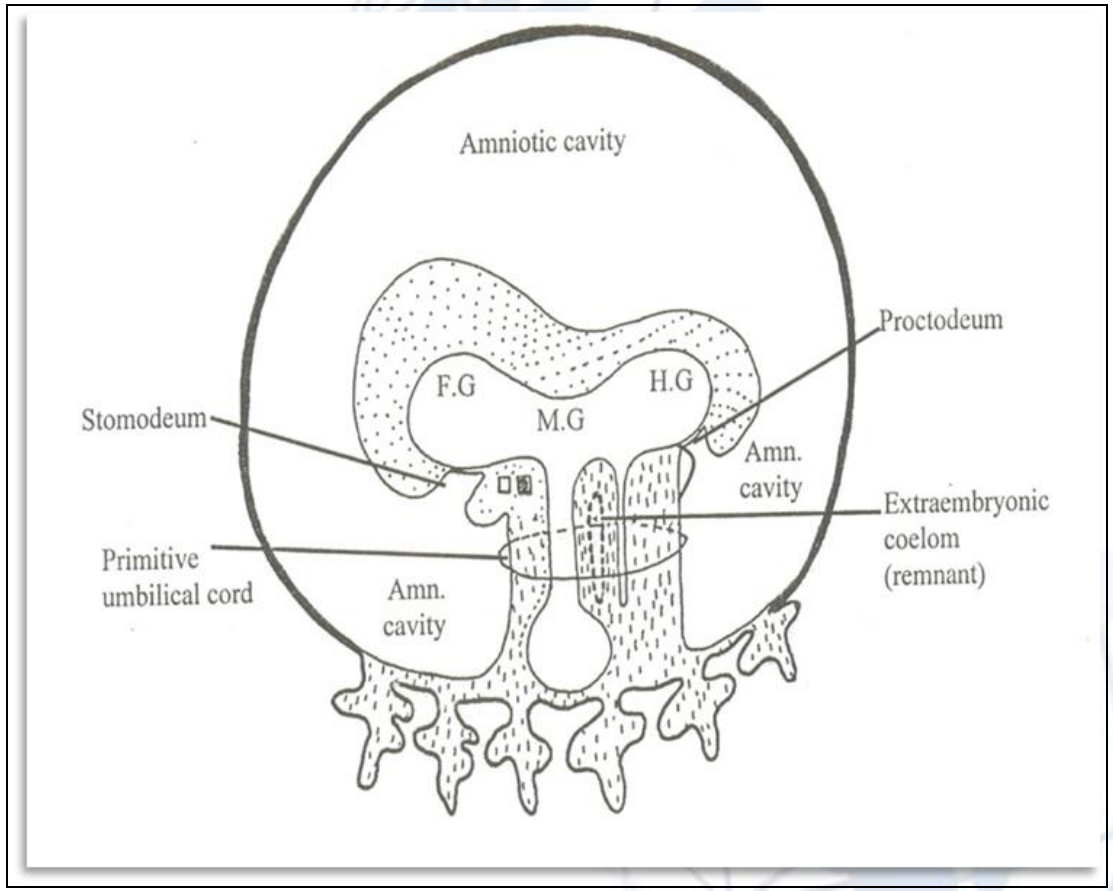

- With folding of the embryo, the endoderm of the intra-embryonic part of the yolk sac gives the gut which has 3 parts : foregut, midgut and hindgut.
- Cloaca is the terminal part of the hindgut. It is closed by the cloacal membrane (ectoderm and endoderm).
- The allanois is a projection of the hindgut that passes through the umbilical cord.

Development of Urinary Bladder

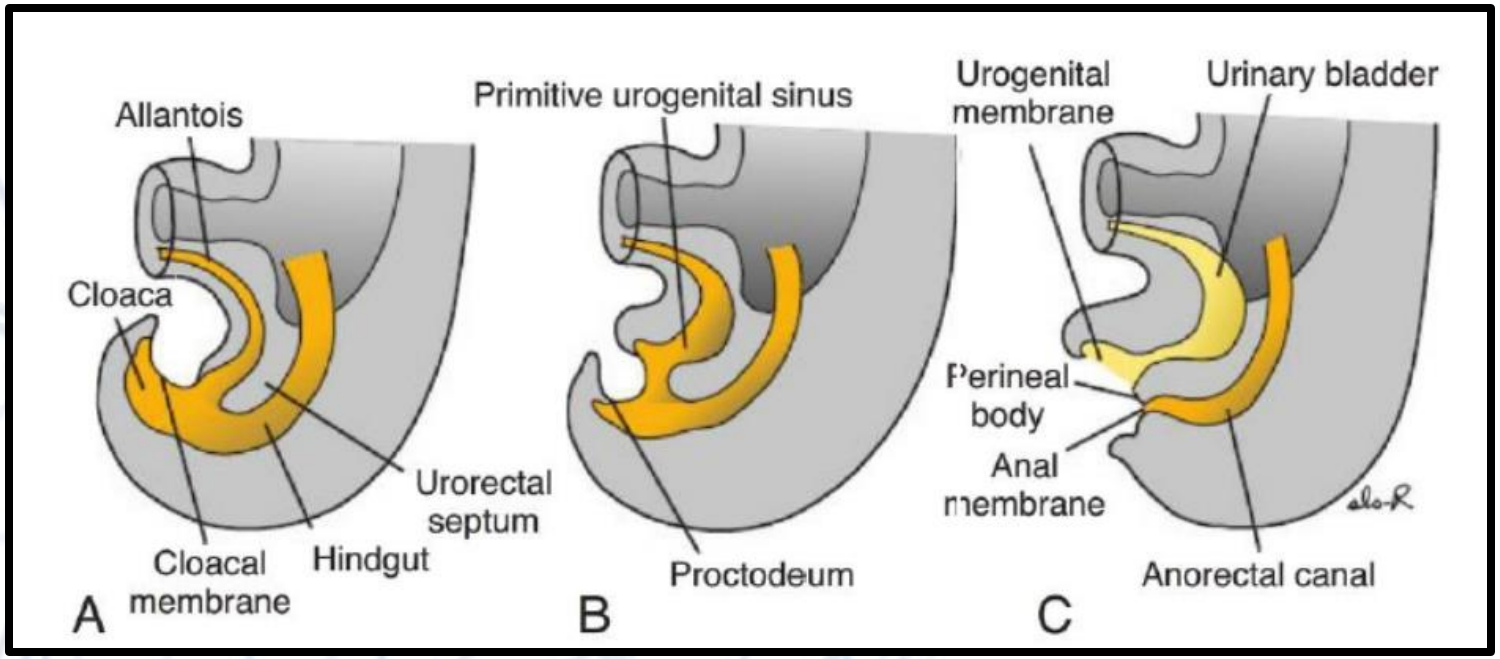

Development of Urinary Bladder

The cloaca (distal part of the hindgut) is divided by the urorectal septum into 2 parts:

A- The primitive urogenital sinus: is the ventral part.

B- The anorectal canal: is the caudal part.
