Sacrum

- It is a triangular bone that forms the posterior bone of the pelvic skeleton. The apex lies below and the base above. It is formed of 5 fused sacral vertebrae.

- The base shows a protrusion (sacral promontory) with an ala on each side.

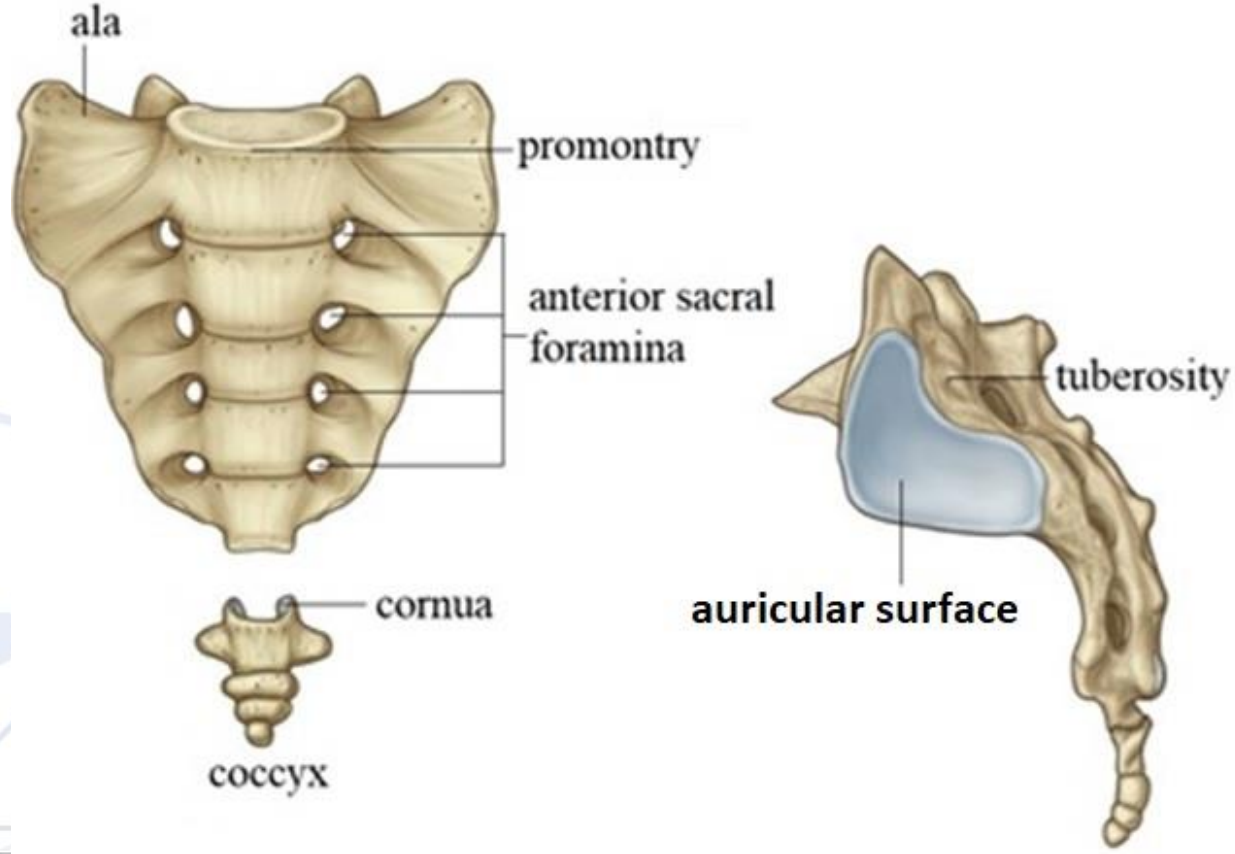

- It has 4 surfaces (anterior, posterior and 2 lateral).

Sacrum

- Anterior surface: (concave) that shows 4 pairs of anterior sacral foramina together with 4 transverse ridges that represent the lines of fusion of the sacral vertebrae. It gives origin to the piriformis muscle.

2- lateral surface: it shows an auricular surface anteriorly and sacral tuberosity behind. The auricular surface articulates with the auricular surface of the hip bone in the sacroiliac joint.

Sacrum

- Posterior surface : (convex) that shows median sacral crest and 4 pairs of posterior sacral foramina. Inferiorly, it shows the sacral hiatus that represents the inferior opening of the sacral canal. The superior opening of the canal is also seen on the posterior surface. The anterior and posterior sacral foramina are connected with the sacral canal.

- 2 Sacral cornua project at the sides of the hiatus to articulate with the cornua of the coccyx.
